Chapter 1

Todo List

Member artdaq::Fragment::dataFrag (sequence_id_t sequenceID, fragment_id_t fragID, InputIterator i, InputIterator e)

Change function access specifier to restrict access

Member artdaq::Fragment::Fragment (const Fragment &)=default

Decide if Copy constructor should be declared =delete

Member artdaq::Fragment::metadataAddress ()

Change function access specifier to restrict access

Member artdaq::Fragment::operator= (const Fragment &)=default

Decide if copy-assignment operator should be declared =delete

Chapter 2

Namespace Index

2.1 Namespace List

Here is a list of all documented namespaces with brief descriptions:

artdaq	
The artdaq namespace	9
artdaq::detail	
Artdaq implementation details namespace	17
artdaq::TimeUtils	
Namespace to hold useful time-converting functions	19
artdaqcore	
Namespace used to differentiate the artdaq_core version of GetPackageBuildInfo from other versions present in the system	23

Chapter 3

Hierarchical Index

3.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

artdaq::ConcurrentQueue< T, EnqPolicy >	25
artdaq::ContainerFragment	32
artdaq::ContainerFragmentLoader	37
std::exception	
artdaq::FailIfFull< T >::QueuelsFull	85
artdaq::FailIfFull< T >	40
filepath_maker	
artdaq::SimpleLookupPolicy	127
artdaq::Fragment	42
artdaq::FragmentGenerator	63
artdaqtest::FragmentGeneratorTest	64
artdaqcore::GetPackageBuildInfo	66
artdaq::detail::hasMemoryUsed< T >	66
artdaq::KeepNewest< T >	67
artdaq::ContainerFragment::Metadata	70
MetadataTypeHuge	70
MetadataTypeOne	71
MetadataTypeTwo	72
artdaq::MonitoredQuantityStats	78
artdaq::MonitoredQuantity	73
artdaq::PackageBuildInfo	84
artdaq::QuickVec< TT_ >	86
artdaq::QuickVec< RawDataType >	86
artdaq::RawEvent	94
artdaq::detail::RawEventHeader	98
artdaq::detail::RawFragmentHeader	99
artdaq::detail::RawFragmentHeaderV0	103
artdaq::RejectNewest< T >	107
artdaq::SharedMemoryEventReceiver	109
artdaq::SharedMemoryManager	114
artdaq::SharedMemoryFragmentManager	112
artdaq::SimpleMemoryReader	128
artdaq::SimpleQueueReader	129

artdaq::StatisticsCollection	130
TraceLock	132

Chapter 4

Class Index

4.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

artdaq::ConcurrentQueue< T, EnqPolicy >	25
artdaq::ContainerFragment	
The <code>artdaq::ContainerFragment</code> class represents a <code>Fragment</code> which contains other Fragments	32
artdaq::ContainerFragmentLoader	
A Read-Write version of the <code>ContainerFragment</code> , used for filling <code>ContainerFragment</code> objects with other <code>Fragment</code> objects	37
artdaq::FailIfFull< T >	
<code>ConcurrentQueue</code> policy to throw an exception when the queue is full	40
artdaq::Fragment	
A <code>Fragment</code> contains the data from one piece of the DAQ system for one event. The <code>artdaq::Fragment</code> is the main data storage class in <code>artdaq</code> . Each <code>Fragment</code> represents the data from one piece of the readout, for one <code>artdaq</code> event. BoardReaders create Fragments and send them to the EventBuilders, where they are assembled into <code>artdaq::RawEvent</code> objects	42
artdaq::FragmentGenerator	
Base class for all FragmentGenerators	63
artdaqtest::FragmentGeneratorTest	
Tests the functionality of the <code>artdaq::FragmentGenerator</code> class	64
artdaqcore::GetPackageBuildInfo	
Wrapper around the <code>artdaqcore::GetPackageBuildInfo::getPackageBuildInfo</code> function	66
artdaq::detail::hasMemoryUsed< T >	66
artdaq::KeepNewest< T >	
<code>ConcurrentQueue</code> policy to discard oldest elements when the queue is full	67
artdaq::ContainerFragment::Metadata	
Contains the information necessary for retrieving <code>Fragment</code> objects from the <code>ContainerFragment</code>	70
MetadataTypeHuge	
Test Metadata that is very large	70
MetadataTypeOne	
Test Metadata with three fields in two long words	71
MetadataTypeTwo	
Test Metadata with five fields, mixing field sizes	72
artdaq::MonitoredQuantity	
This class keeps track of statistics for a set of sample values and provides timing information on the samples	73

<code>artdaq::MonitoredQuantityStats</code>	Struct containing <code>MonitoredQuantity</code> data	78
<code>artdaq::PackageBuildInfo</code>	Class holding information about the <code>artdaq</code> package build	84
<code>artdaq::FailIfFull< T >::QueueIsFull</code>	Exception thrown by <code>FailIfFull</code> policy when an enqueue operation is attempted on a full queue	85
<code>artdaq::QuickVec< TT_ ></code>	A <code>QuickVec</code> behaves like a <code>std::vector</code> , but does no initialization of its data, making it faster at the cost of having to ensure that uninitialized data is not read	86
<code>artdaq::RawEvent</code>	<code>RawEvent</code> is the <code>artdaq</code> view of a generic event, containing a header and zero or more <code>Fragments</code>	94
<code>artdaq::detail::RawEventHeader</code>	The header information used to identify key properties of the <code>RawEvent</code> object	98
<code>artdaq::detail::RawFragmentHeader</code>	Basic fields used by <code>artdaq</code> for routing <code>Fragment</code> objects through the system	99
<code>artdaq::detail::RawFragmentHeaderV0</code>	Basic fields used by <code>artdaq</code> for routing <code>Fragment</code> objects through the system	103
<code>artdaq::RejectNewest< T ></code>	ConcurrentQueue policy to discard new elements when the queue is full	107
<code>artdaq::SharedMemoryEventReceiver</code>	<code>SharedMemoryEventReceiver</code> can receive events (as written by <code>SharedMemoryEventManager</code>) from Shared Memory	109
<code>artdaq::SharedMemoryFragmentManager</code>	The <code>SharedMemoryFragmentManager</code> is a <code>SharedMemoryManager</code> that deals with <code>Fragment</code> transfers using a <code>SharedMemoryManager</code>	112
<code>artdaq::SharedMemoryManager</code>	The <code>SharedMemoryManager</code> creates a Shared Memory area which is divided into a number of fixed-size buffers. It provides for multiple readers and multiple writers through a dual semaphore system	114
<code>artdaq::SimpleLookupPolicy</code>	This class is intended to find files using a set lookup order	127
<code>artdaq::SimpleMemoryReader</code>	<code>SimpleMemoryReader</code> will continue to read <code>RawEvent</code> objects off the queue until it encounters a null pointer, at which point it stops	128
<code>artdaq::SimpleQueueReader</code>	<code>SimpleQueueReader</code> will continue to read <code>RawEvent</code> objects off the queue until it encounters a null pointer, at which point it stops	129
<code>artdaq::StatisticsCollection</code>	A collection of <code>MonitoredQuantity</code> instances describing low-level statistics of the <code>artdaq</code> system	130
<code>TraceLock</code>	Allows a user to debug the acquisition and releasing of locks, by wrapping the <code>unique_lock<std::mutex></code> API with TRACE calls	132

Chapter 5

Namespace Documentation

5.1 artdaq Namespace Reference

The artdaq namespace.

Namespaces

- [detail](#)
artdaq implementation details namespace
- [TimeUtils](#)
Namespace to hold useful time-converting functions.

Classes

- struct [FailIfFull](#)
ConcurrentQueue policy to throw an exception when the queue is full.
- struct [KeepNewest](#)
ConcurrentQueue policy to discard oldest elements when the queue is full.
- struct [RejectNewest](#)
ConcurrentQueue policy to discard new elements when the queue is full.
- class [ConcurrentQueue](#)
- struct [MonitoredQuantityStats](#)
struct containing MonitoredQuantity data
- class [MonitoredQuantity](#)
This class keeps track of statistics for a set of sample values and provides timing information on the samples.
- struct [QuickVec](#)
A QuickVec behaves like a std::vector, but does no initialization of its data, making it faster at the cost of having to ensure that uninitialized data is not read.
- class [SharedMemoryEventReceiver](#)
SharedMemoryEventReceiver can receive events (as written by SharedMemoryEventManager) from Shared Memory.
- class [SharedMemoryFragmentManager](#)
The SharedMemoryFragmentManager is a SharedMemoryManager that deals with Fragment transfers using a SharedMemoryManager.
- class [SharedMemoryManager](#)

The [SharedMemoryManager](#) creates a Shared Memory area which is divided into a number of fixed-size buffers. It provides for multiple readers and multiple writers through a dual semaphore system.

- class [SimpleMemoryReader](#)

[SimpleMemoryReader](#) will continue to read [RawEvent](#) objects off the queue until it encounters a null pointer, at which point it stops.

- class [SimpleQueueReader](#)

[SimpleQueueReader](#) will continue to read [RawEvent](#) objects off the queue until it encounters a null pointer, at which point it stops.

- class [StatisticsCollection](#)

A collection of [MonitoredQuantity](#) instances describing low-level statistics of the artdaq system.

- class [ContainerFragment](#)

The [artdaq::ContainerFragment](#) class represents a [Fragment](#) which contains other [Fragments](#).

- class [ContainerFragmentLoader](#)

A Read-Write version of the [ContainerFragment](#), used for filling [ContainerFragment](#) objects with other [Fragment](#) objects.

- class [Fragment](#)

A [Fragment](#) contains the data from one piece of the DAQ system for one event. The [artdaq::Fragment](#) is the main data storage class in artdaq. Each [Fragment](#) represents the data from one piece of the readout, for one artdaq event. Board-Readers create [Fragments](#) and send them to the [EventBuilders](#), where they are assembled into [artdaq::RawEvent](#) objects.

- class [PackageBuildInfo](#)

Class holding information about the artdaq package build.

- class [RawEvent](#)

[RawEvent](#) is the artdaq view of a generic event, containing a header and zero or more [Fragments](#).

- class [FragmentGenerator](#)

Base class for all [FragmentGenerators](#).

- class [SimpleLookupPolicy](#)

This class is intended to find files using a set lookup order.

Typedefs

- [typedef std::shared_ptr< RawEvent > RawEvent_ptr](#)

A smart pointer to a [RawEvent](#) object.

- [typedef artdaq::ConcurrentQueue< RawEvent_ptr > RawEventQueue](#)

A [ConcurrentQueue](#) of [RawEvent](#) objects.

- [typedef std::shared_ptr< MonitoredQuantity > MonitoredQuantityPtr](#)

A shared_ptr to a [MonitoredQuantity](#) instance.

- [typedef detail::RawFragmentHeader::RawDataType RawDataType](#)

The [RawDataType](#) (currently a 64-bit integer) is the basic unit of data representation within artdaq

- [typedef std::vector< Fragment > Fragments](#)

A std::vector of [Fragment](#) objects.

- [typedef std::unique_ptr< Fragment > FragmentPtr](#)

A std::unique_ptr to a [Fragment](#) object.

- [typedef std::list< FragmentPtr > FragmentPtrs](#)

A std::list of [FragmentPtrs](#).

- [typedef std::unique_ptr< artdaq::FragmentGenerator > makeFunc_t \(fhid::ParameterSet const &ps\)](#)

Constructs a [FragmentGenerator](#) instance, and returns a pointer to it.

Enumerations

- enum `ExceptionHandlerRethrow` { `ExceptionHandlerRethrow::yes`, `ExceptionHandlerRethrow::no` }

Controls whether the `ExceptionHandler` will rethrow after printing exception details.

Functions

- `RawEventQueue & getGlobalQueue (RawEventQueue::SizeType maxSize=std::numeric_limits< RawEventQueue::SizeType >::max())`

The first thread to call `getGlobalQueue()` causes the creation of the queue. The queue will be destroyed at static destruction time.

- int `SimpleMemoryReaderApp (int argc, char **argv)`

An application which pops items off a `RawEventQueue` using the `SimpleMemoryReader`.

- int `simpleQueueReaderApp (int argc, char **argv)`

An application which pops items off a `RawEventQueue` using the `SimpleQueueReader`.

- bool `fragmentSequenceIDCompare (Fragment i, Fragment j)`

Comparator for `Fragment` objects, based on their `sequence_id`.

- std::ostream & `operator<< (std::ostream &os, Fragment const &f)`

Prints the given `Fragment` to the stream.

- std::ostream & `operator<< (std::ostream &os, RawEvent const &ev)`

Prints the `RawEvent` to the given stream.

- std::unique_ptr

< `FragmentGenerator` > `makeFragmentGenerator (std::string const &generator_plugin_spec, fhicl::ParameterSet const &ps)`

Instantiates the `FragmentGenerator` plugin with the given name, using the given ParameterSet.

- std::string `generateMessageFacilityConfiguration (char const *progname, bool useConsole=true, bool printDebug=false)`

Create the MessageFacility configuration Fhicl string.

- void `configureMessageFacility (char const *progname, bool useConsole=true, bool printDebug=false)`

Configure and start the message facility. Provide the program name so that messages will be appropriately tagged.

- void `setMsgFacAppName (const std::string &appType, unsigned short port)`

Set the message facility application name using the specified application type and port number.

- void `ExceptionHandler (ExceptionHandlerRethrow decision, std::string optional_message="")`

The `ExceptionHandler` class prints out all available information about an exception, then optionally re-throws.

Variables

- static const int `CONTAINER_FRAGMENT_COUNT_MAX` = 100

The maximum capacity of the `ContainerFragment` (in fragments)

5.1.1 Detailed Description

The artdaq namespace.

5.1.2 Typedef Documentation

5.1.2.1 `typedef std::unique_ptr<Fragment> artdaq::FragmentPtr`

A `std::unique_ptr` to a [Fragment](#) object.

To reduce move or copy operations, most `artdaq` processing is done using `FragmentPtr` objects.

Definition at line 53 of file `Fragment.hh`.

5.1.2.2 `typedef std::unique_ptr<artdaq::FragmentGenerator> artdaq::makeFunc_t(fhicl::ParameterSet const &ps)`

Constructs a [FragmentGenerator](#) instance, and returns a pointer to it.

Parameters

<code>ps</code>	Parameter set for initializing the FragmentGenerator
-----------------	--

Returns

A smart pointer to the [FragmentGenerator](#)

Definition at line 16 of file `GeneratorMacros.hh`.

5.1.2.3 `typedef detail::RawFragmentHeader::RawDataType artdaq::RawDataType`

The `RawDataType` (currently a 64-bit integer) is the basic unit of data representation within `artdaq`

The `RawDataType` (currently a 64-bit integer) is the basic unit of data representation within `artdaq` Copied from `RawFragmentHeader` into [Fragment](#)

Definition at line 39 of file `Fragment.hh`.

5.1.2.4 `typedef std::shared_ptr< RawEvent > artdaq::RawEvent_ptr`

A smart pointer to a [RawEvent](#) object.

A `shared_ptr` to a [RawEvent](#).

Definition at line 13 of file `GlobalQueue.hh`.

5.1.3 Enumeration Type Documentation

5.1.3.1 `enum artdaq::ExceptionHandlerRethrow [strong]`

Controls whether the `ExceptionHandler` will rethrow after printing exception details.

Enumerator

yes Rethrow the exception after sending details to `MessageFacility`.

no Consume the exception and proceed.

Definition at line 11 of file `ExceptionHandler.hh`.

5.1.4 Function Documentation

5.1.4.1 `void artdaq::configureMessageFacility(char const * progname, bool useConsole = true, bool printDebug = false)`

Configure and start the message facility. Provide the program name so that messages will be appropriately tagged.

Parameters

<i>programe</i>	The name of the program
<i>useConsole</i>	Should console output be activated? Default = true
<i>printDebug</i>	Whether Debug-level messages should be printed to console. Default = false

Definition at line 187 of file configureMessageFacility.cc.

5.1.4.2 void artdaq::ExceptionHandler (*ExceptionHandlerRethrow decision, std::string optional_message = " "*)

The `ExceptionHandler` class prints out all available information about an exception, then optionally re-throws.

Parameters

<i>decision</i>	Controls whether the <code>ExceptionHandler</code> will rethrow (<code>ExceptionHandlerRethrow::yes</code>) or not (<code>ExceptionHandlerRethrow::no</code>)
<i>optional_message</i>	An optional <code>std::string</code> giving more information about where the exception was originally caught

JCF, 5/28/15

The `ExceptionHandler()` function is designed to be called within a catch-all block:

```
try {
    // ...Code that might throw an exception...
} catch (...) {
    ExceptionHandler(artdaq::ExceptionHandlerRethrow::yes
        , "Optional string providing additional info");
}
```

Where above, you could switch out `artdaq::ExceptionHandlerRethrow::yes` with `artdaq::ExceptionHandlerRethrow::no`, depending on what you wish to do

The details of `ExceptionHandler()` are as follows:

- If an optional string is passed to it, use messagefacility to write the string with `mf::LogError()`
- Apply a set of different catch-blocks to the original exception, printing out as much information as possible contained within the different exception types (`art::Exception`, `cet::exception`, `boost::exception` and `std::exception`), again using `mf::LogError()`
- If `artdaq::ExceptionHandlerRethrow::yes` was passed to `ExceptionHandler()`, re-throw the exception rather than swallow it

Definition at line 11 of file ExceptionHandler.cc.

5.1.4.3 bool artdaq::fragmentSequenceIDCompare (*Fragment i, Fragment j*)

Comparator for `Fragment` objects, based on their `sequence_id`.

Parameters

<i>i</i>	First <code>Fragment</code> to compare
----------	--

<i>j</i>	Second Fragment to compare
----------	--

Returns

i.sequenceID() < j.sequenceID()

Definition at line 8 of file Fragment.cc.

5.1.4.4 std::string artdaq::generateMessageFacilityConfiguration (*char const * progrname, bool useConsole = true, bool printDebug = false*)

Create the MessageFacility configuration Fhicl string.

Parameters

<i>progrname</i>	The name of the program
<i>useConsole</i>	Should console output be activated? Default = true
<i>printDebug</i>	Whether Debug-level messages should be printed to console. Default = false

Returns

Fhicl string with generated MessageFacility configuration

Exceptions

<i>cet::exception</i>	if log path or ARTDAQ_LOG_FHICL do not exist
-----------------------	--

Definition at line 17 of file configureMessageFacility.cc.

5.1.4.5 RawEventQueue & artdaq::getGlobalQueue (*RawEventQueue::SizeType maxSize = std::numeric_limits< RawEventQueue::SizeType >::max()*)

The first thread to call [getGlobalQueue\(\)](#) causes the creation of the queue. The queue will be destroyed at static destruction time.

Parameters

<i>maxSize</i>	Maximum number of elements in the queue
----------------	---

Returns

Reference to the global RawEventQueue

Definition at line 10 of file GlobalQueue.cc.

5.1.4.6 std::unique_ptr< artdaq::FragmentGenerator > artdaq::makeFragmentGenerator (*std::string const & generator_plugin_spec, fhicl::ParameterSet const & ps*)

Instantiates the [FragmentGenerator](#) plugin with the given name, using the given ParameterSet.

Parameters

<code>generator_plugin-spec</code>	Name of the Generator plugin (omit _generator.so)
<code>ps</code>	The ParameterSet used to initialize the FragmentGenerator

Returns

A smart pointer to the [FragmentGenerator](#) instance

Definition at line 8 of file makeFragmentGenerator.cc.

5.1.4.7 std::ostream & artdaq::operator<< (std::ostream & os, artdaq::Fragment const & f) [inline]

Prints the given [Fragment](#) to the stream.

Parameters

<code>os</code>	Stream to print Fragment to
<code>f</code>	Fragment to print

Returns

Reference to the stream

Definition at line 1198 of file Fragment.hh.

5.1.4.8 std::ostream& artdaq::operator<< (std::ostream & os, RawEvent const & ev) [inline]

Prints the [RawEvent](#) to the given stream.

Parameters

<code>os</code>	Stream to print RawEvent to
<code>ev</code>	RawEvent to print

Returns

Stream reference

Definition at line 288 of file RawEvent.hh.

5.1.4.9 void artdaq::setMsgFacAppName (const std::string & appType, unsigned short port)

Set the message facility application name using the specified application type and port number.

Parameters

<code>appType</code>	Application name
<code>port</code>	XMLRPC port of this application instance

Definition at line 207 of file configureMessageFacility.cc.

5.1.4.10 int artdaq::SimpleMemoryReaderApp (int argc, char ** argv)

An application which pops items off a RawEventQueue using the [SimpleMemoryReader](#).

Parameters

<i>argc</i>	Number of arguments (OS-provided)
<i>argv</i>	Array of argument strings (OS-provided)

Returns

Status code: 0 success, 1 for any error

SimpleMemoryReaderApp is a function that can be used in place of artapp(), to read [RawEvent](#) objects from the shared [RawEvent](#) queue. Note that it ignores both of its arguments.

Definition at line 12 of file SimpleMemoryReader.cc.

5.1.4.11 int artdaq::simpleQueueReaderApp (int *argc*, char ** *argv*)

An application which pops items off a RawEventQueue using the [SimpleQueueReader](#).

Parameters

<i>argc</i>	Number of arguments (OS-provided)
<i>argv</i>	Array of argument strings (OS-provided)

Returns

Status code: 0 success, 1 for any error

simpleQueueReaderApp is a function that can be used in place of artapp(), to read [RawEvent](#) objects from the shared [RawEvent](#) queue. Note that it ignores both of its arguments.

Definition at line 12 of file SimpleQueueReader.cc.

5.2 artdaq::detail Namespace Reference

artdaq implementation details namespace

Classes

- class [hasMemoryUsed](#)
- struct [RawFragmentHeader](#)

The RawFragmentHeader class contains the basic fields used by artdaq for routing Fragment objects through the system.

- struct [RawFragmentHeaderV0](#)

The RawFragmentHeaderV0 class contains the basic fields used by artdaq for routing Fragment objects through the system.

- struct [RawEventHeader](#)

The header information used to identify key properties of the RawEvent object.

Typedefs

- typedef std::chrono::duration<double> [seconds](#)
- typedef size_t [MemoryType](#)

Basic unit of data storage and pointer types.

Functions

- template<typename T >
MemoryType **memoryUsage** (const std::pair< T, size_t > &t)
Returns the memory used by an object.
- template<typename T >
std::enable_if< hasMemoryUsed
< T >::value, **MemoryType** >
::type **memoryUsage** (const T &t)
*Returns the memory used by an object. Uses **hasMemoryUsed** to determine if there is a **memoryUsed** function in object.*
- template<typename T >
std::enable_if<!hasMemoryUsed
< T >::value, **MemoryType** >
::type **memoryUsage** (const T &t)
Returns the memory used by an object, as obtained through sizeof.

5.2.1 Detailed Description

artdaq implementation details namespace Class template **ConcurrentQueue** provides a FIFO that can be used to communicate data between multiple producer and consumer threads in an application.

The template policy EnqPolicy determines the behavior of the enqNowait function. In all cases, this function will return promptly (that is, it will not wait for a full queue to become not-full). However, what is done in the case of the queue being full depends on the policy chosen:

FailIfFull: a std::exception is thrown if the queue is full.

KeepNewest: the head of the FIFO is popped (and destroyed), and the new item is added to the FIFO. The function returns the number of popped (dropped) element.

RejectNewest: the new item is not put onto the FIFO. The function returns the dropped event count (1) if the item cannot be added.

5.2.2 Typedef Documentation

5.2.2.1 `typedef std::chrono::duration<double> artdaq::detail::seconds`

We shall use **artdaq::detail::seconds** as our "standard" duration type. Note that this differs from std::chrono::seconds, which has a representation in some integer type of at least 35 bits.

daqrate::duration dur(1.0) represents a duration of 1 second. daqrate::duration dur2(0.001) represents a duration of 1 millisecond.

Definition at line 61 of file ConcurrentQueue.hh.

5.2.3 Function Documentation

5.2.3.1 `template<typename T > MemoryType artdaq::detail::memoryUsage (const std::pair< T, size_t > &t)`

Returns the memory used by an object.

Template Parameters

<i>T</i>	The type of the object
----------	------------------------

Parameters

<i>t</i>	A pair of object and size_t
----------	-----------------------------

Returns

If the object has a memoryUsed function, the result of that function. Otherwise 0.

Definition at line 110 of file ConcurrentQueue.hh.

**5.2.3.2 template<typename T > std::enable_if<hasMemoryUsed<T>::value, MemoryType>::type
artdaq::detail::memoryUsage (const T & t)**

Returns the memory used by an object. Uses [hasMemoryUsed](#) to determine if there is a memoryUsed function in object.

Template Parameters

<i>T</i>	Type of object t
----------	------------------

Parameters

<i>t</i>	Object to retrieve memory usage from
----------	--------------------------------------

Returns

Self-reported memory usage of object

Definition at line 129 of file ConcurrentQueue.hh.

**5.2.3.3 template<typename T > std::enable_if<!hasMemoryUsed<T>::value, MemoryType>::type
artdaq::detail::memoryUsage (const T & t)**

Returns the memory used by an object, as obtained through sizeof.

Template Parameters

<i>T</i>	Type of object t
----------	------------------

Parameters

<i>t</i>	Object to retrieve memory usage from
----------	--------------------------------------

Returns

sizeof(t)

Definition at line 148 of file ConcurrentQueue.hh.

5.3 artdaq::TimeUtils Namespace Reference

Namespace to hold useful time-converting functions.

Typedefs

- `typedef std::chrono::duration< double, std::ratio< 1 > > seconds`

Functions

- `constexpr double GetElapsedTime (std::chrono::steady_clock::time_point then, std::chrono::steady_clock::time_point now=std::chrono::steady_clock::now())`
Get the number of seconds in the given interval
- `constexpr size_t GetElapsedTimeMicroseconds (std::chrono::steady_clock::time_point then, std::chrono::steady_clock::time_point now=std::chrono::steady_clock::now())`
Gets the number of microseconds in the given time interval
- `constexpr size_t GetElapsedTimeMilliseconds (std::chrono::steady_clock::time_point then, std::chrono::steady_clock::time_point now=std::chrono::steady_clock::now())`
Gets the number of milliseconds in the given time interval
- `std::string convertUnixTimeToString (time_t inputUnixTime)`
Converts a Unix time to its string representation, in UTC.
- `std::string convertUnixTimeToString (struct timeval const &inputUnixTime)`
Converts a Unix time to its string representation, in UTC.
- `std::string convertUnixTimeToString (struct timespec const &inputUnixTime)`
Converts a Unix time to its string representation, in UTC.
- `uint64_t gettimeofday_us ()`
Get the current time of day in microseconds (from gettimeofday system call)

5.3.1 Detailed Description

Namespace to hold useful time-converting functions.

5.3.2 Typedef Documentation

5.3.2.1 `typedef std::chrono::duration<double, std::ratio<1> > artdaq::TimeUtils::seconds`

We shall use `artdaq::detail::seconds` as our "standard" duration type. Note that this differs from `std::chrono::seconds`, which has a representation in some integer type of at least 35 bits.

`daqrate::duration dur(1.0)` represents a duration of 1 second. `daqrate::duration dur2(0.001)` represents a duration of 1 millisecond.

Definition at line 24 of file TimeUtils.hh.

5.3.3 Function Documentation

5.3.3.1 `std::string artdaq::TimeUtils::convertUnixTimeToString (time_t inputUnixTime)`

Converts a Unix time to its string representation, in UTC.

Parameters

<i>inputUnixTime</i>	A time_t Unix time variable
----------------------	-----------------------------

Returns

std::string representation of Unix time, in UTC

Definition at line 7 of file TimeUtils.cc.

5.3.3.2 std::string artdaq::TimeUtils::convertUnixTimeToString (struct timeval const & *inputUnixTime*)

Converts a Unix time to its string representation, in UTC.

Parameters

<i>inputUnixTime</i>	A struct timeval Unix time variable
----------------------	-------------------------------------

Returns

std::string representation of Unix time, in UTC

Definition at line 18 of file TimeUtils.cc.

5.3.3.3 std::string artdaq::TimeUtils::convertUnixTimeToString (struct timespec const & *inputUnixTime*)

Converts a Unix time to its string representation, in UTC.

Parameters

<i>inputUnixTime</i>	A struct timespec Unix time variable
----------------------	--------------------------------------

Returns

std::string representation of Unix time, in UTC

Definition at line 35 of file TimeUtils.cc.

5.3.3.4 constexpr double artdaq::TimeUtils::GetElapsedTime (std::chrono::steady_clock::time_point *then*, std::chrono::steady_clock::time_point *now* = std::chrono::steady_clock::now()) [inline]

Get the number of seconds in the given interval

Parameters

<i>then</i>	std::chrono::steady_clock::time_point representing start of interval
<i>now</i>	std::chrono::steady_clock::time_point representing end of interval. Defaults to std::chrono::steady_clock::now()

Returns

Seconds in time interval, expressed as double

Definition at line 32 of file TimeUtils.hh.

```
5.3.3.5 constexpr size_t artdaq::TimeUtils::GetElapsedMicroseconds ( std::chrono::steady_clock::time_point then,  
std::chrono::steady_clock::time_point now = std::chrono::steady_clock::now() ) [inline]
```

Gets the number of microseconds in the given time interval

Parameters

<i>then</i>	std::chrono::steady_clock::time_point representing start of interval
<i>now</i>	std::chrono::steady_clock::time_point representing end of interval. Defaults to std::chrono::steady_clock::now()

Returns

Microseconds in time interval

Definition at line 43 of file TimeUtils.hh.

5.3.3.6 constexpr size_t artdaq::TimeUtils::GetElapsedMilliseconds (std::chrono::steady_clock::time_point *then*, std::chrono::steady_clock::time_point *now* = std::chrono::steady_clock::now()) [inline]

Gets the number of milliseconds in the given time interval

Parameters

<i>then</i>	std::chrono::steady_clock::time_point representing start of interval
<i>now</i>	std::chrono::steady_clock::time_point representing end of interval. Defaults to std::chrono::steady_clock::now()

Returns

Milliseconds in time interval

Definition at line 54 of file TimeUtils.hh.

5.3.3.7 uint64_t artdaq::TimeUtils::gettimeofday_us ()

Get the current time of day in microseconds (from gettimeofday system call)

Returns

The current time of day in microseconds

Definition at line 51 of file TimeUtils.cc.

5.4 artdaqcore Namespace Reference

Namespace used to differentiate the artdaq_core version of [GetPackageBuildInfo](#) from other versions present in the system.

Classes

- struct [GetPackageBuildInfo](#)

Wrapper around the artdaqcore::GetPackageBuildInfo::getPackageBuildInfo function.

5.4.1 Detailed Description

Namespace used to differentiate the artdaq_core version of [GetPackageBuildInfo](#) from other versions present in the system.

Chapter 6

Class Documentation

6.1 artdaq::ConcurrentQueue< T, EnqPolicy > Class Template Reference

```
#include <artdaq-core/Core/ConcurrentQueue.hh>
```

Public Types

- `typedef EnqPolicy::ValueType ValueType`
Type of values stored in `ConcurrentQueue`.
- `typedef EnqPolicy::SequenceType SequenceType`
Type of sequence used by `ConcurrentQueue`.
- `typedef SequenceType::size_type SizeType`
Type for indexes in sequence.

Public Member Functions

- `ConcurrentQueue (SizeType maxSize=std::numeric_limits< SizeType >::max(), detail::MemoryType maxMemory=std::numeric_limits< detail::MemoryType >::max())`
`ConcurrentQueue` is always bounded. By default, the bound is absurdly large.
- `~ConcurrentQueue ()`
- `EnqPolicy::ReturnType enqNowait (T const &item)`
Add a copy if item to the queue, according to the rules determined by the `EnqPolicy`.
- `void enqWait (T const &item)`
Add a copy of item to the queue.
- `bool enqTimedWait (T const &item, detail::seconds const &wait)`
Add a copy of item to the queue, waiting for the queue to be non-full.
- `bool deqNowait (ValueType &item)`
Assign the value at the head of the queue to item and then remove the head of the queue.
- `void deqWait (ValueType &item)`
Assign the value of the head of the queue to item and then remove the head of the queue.
- `bool deqTimedWait (ValueType &item, detail::seconds const &wait)`
Assign the value at the head of the queue to item and then remove the head of the queue.
- `bool empty () const`

- `bool full () const`
Return the capacity of the queue, that is, the maximum number of items it can contain.
- `SizeType size () const`
Return the memory in bytes used by items in the queue.
- `SizeType capacity () const`
Return the memory of the queue in bytes, that is, the maximum memory the items in the queue may occupy.
- `bool setCapacity (SizeType capacity)`
Reset the memory usage in bytes of the queue. A value of 0 disabled the memory check. This can only be done if the queue is empty.
- `detail::MemoryType used () const`
Is the reader connected and ready for items to appear on the queue?
- `bool queueReaderIsReady () const`
Set the ready flag for the reader.
- `void addExternallyDroppedEvents (SizeType dropped)`
Adds the passed count to the counter of dropped events.
- `bool setReaderIsReady (bool rdy=true)`
Gets the time at which the queue became ready.
- `std::chrono::steady_clock::time_point getReadyTime () const`

6.1.1 Detailed Description

```
template<class T, class EnqPolicy = FailIfFull<T>> class artdaq::ConcurrentQueue< T, EnqPolicy >
```

ConcurrentQueue<T> class template declaration.

Definition at line 414 of file ConcurrentQueue.hh.

6.1.2 Constructor & Destructor Documentation

```
6.1.2.1 template<class T , class EnqPolicy > artdaq::ConcurrentQueue< T, EnqPolicy >::ConcurrentQueue ( 
    SizeType maxSize = std::numeric_limits<SizeType>::max(), detail::MemoryType maxMemory = 
    std::numeric_limits<detail::MemoryType>::max() ) [explicit]
```

ConcurrentQueue is always bounded. By default, the bound is absurdly large.

Parameters

<code>maxSize</code>	Maximum size of the <code>ConcurrentQueue</code> (default: <code>SizeType::max</code>)
<code>maxMemory</code>	Maximum memory size of the <code>ConcurrentQueue</code> (default: <code>MemoryType::max</code>)

Definition at line 708 of file ConcurrentQueue.hh.

```
6.1.2.2 template<class T , class EnqPolicy > artdaq::ConcurrentQueue< T, EnqPolicy >::~ConcurrentQueue ( )
```

Applications should arrange to make sure that the destructor of a `ConcurrentQueue` is not called while some other thread is using that queue. There is some protection against doing this, but it seems impossible to make sufficient protection.

Definition at line 723 of file ConcurrentQueue.hh.

6.1.3 Member Function Documentation

6.1.3.1 template<class T , class EnqPolicy > void artdaq::ConcurrentQueue< T, EnqPolicy >::addExternallyDroppedEvents (SizeType *dropped*)

Adds the passed count to the counter of dropped events.

Parameters

<i>dropped</i>	Number of events dropped by code outside ConcurrentQueue
----------------	--

Definition at line 894 of file ConcurrentQueue.hh.

6.1.3.2 template<class T , class EnqPolicy > ConcurrentQueue< T, EnqPolicy >::SizeType artdaq::ConcurrentQueue< T, EnqPolicy >::capacity () const

Return the capacity of the queue, that is, the maximum number of items it can contain.

Returns

The maximum number of items the [ConcurrentQueue](#) can contain

Definition at line 837 of file ConcurrentQueue.hh.

6.1.3.3 template<class T , class EnqPolicy > ConcurrentQueue< T, EnqPolicy >::SizeType artdaq::ConcurrentQueue< T, EnqPolicy >::clear ()

Remove all items from the queue. This changes the size to zero but does not change the capacity.

Returns

The number of cleared events.

Definition at line 881 of file ConcurrentQueue.hh.

6.1.3.4 template<class T , class EnqPolicy > bool artdaq::ConcurrentQueue< T, EnqPolicy >::deqNowait (ValueType & *item*)

Assign the value at the head of the queue to item and then remove the head of the queue.

Parameters

<i>item</i>	Reference to output item
-------------	--------------------------

Returns

If the dequeue operation was successful

Assign the value at the head of the queue to item and then remove the head of the queue. If successful, return true; on failure, return false. This function will fail without waiting if the queue is empty. This function may throw any exception thrown by the assignment operator of type EnqPolicy::ValueType.

Definition at line 776 of file ConcurrentQueue.hh.

6.1.3.5 template<class T , class EnqPolicy > bool artdaq::ConcurrentQueue< T, EnqPolicy >::deqTimedWait (ValueType & item, detail::seconds const & wait)

Assign the value at the head of the queue to item and then remove the head of the queue.

Parameters

<i>item</i>	Reference to output item
<i>wait</i>	Maximum number of seconds to wait for dequeue

Returns

Whether an item was dequeued in the given interval

Assign the value at the head of the queue to item and then remove the head of the queue. If the queue is empty wait until it has become non-empty or until timeDuration has passed. Return true if an item has been removed from the queue or false if the timeout has expired. This may throw any exception thrown by the assignment operator of type EnqPolicy::ValueType.

Definition at line 796 of file ConcurrentQueue.hh.

6.1.3.6 template<class T , class EnqPolicy > void artdaq::ConcurrentQueue< T, EnqPolicy >::deqWait (ValueType & *item*)

Assign the value of the head of the queue to item and then remove the head of the queue.

Parameters

<i>item</i>	Reference to output item
-------------	--------------------------

Assign the value of the head of the queue to item and then remove the head of the queue. If the queue is empty wait until it has become non-empty. This may throw any exception thrown by the assignment operator of type EnqPolicy::ValueType.

Definition at line 786 of file ConcurrentQueue.hh.

6.1.3.7 template<class T , class EnqPolicy > bool artdaq::ConcurrentQueue< T, EnqPolicy >::empty () const

Return true if the queue is empty, and false if it is not.

Returns

True if the queue is empty

Definition at line 813 of file ConcurrentQueue.hh.

6.1.3.8 template<class T, class EnqPolicy > EnqPolicy::ReturnType artdaq::ConcurrentQueue< T, EnqPolicy >::enqNowait (T const & *item*)

Add a copy of item to the queue, according to the rules determined by the EnqPolicy.

Copying a [ConcurrentQueue](#) is illegal, as is assigning to a [ConcurrentQueue](#). The copy constructor and copy assignment operator are both private and deleted.

Parameters

<i>item</i>	Item to enqueue
-------------	-----------------

Returns

EnqPolicy::ReturnType result of enqueue operation

Add a copy if item to the queue, according to the rules determined by the EnqPolicy; see documentation above the the provided EnqPolicy choices. This may throw any exception thrown by the assignment operator of type T, or badAlloc.

Definition at line 736 of file ConcurrentQueue.hh.

6.1.3.9 template<class T, class EnqPolicy > bool artdaq::ConcurrentQueue< T, EnqPolicy >::enqTimedWait (T const & *item*, detail::seconds const & *wait*)

Add a copy of item to the queue, waiting for the queue to be non-full.

Parameters

<i>item</i>	Item to enqueue
<i>wait</i>	Maximum time (in seconds) to wait for queue to be non-full

Returns

Whether the item was added before the timeout expired

Add a copy of item to the queue. If the queue is full wait until it becomes non-full or until timeDuration has passed. Return true if the items has been put onto the queue or false if the timeout has expired. This may throw any exception thrown by the assignment operator of T, or badAlloc.

Definition at line 758 of file ConcurrentQueue.hh.

6.1.3.10 template<class T, class EnqPolicy > void artdaq::ConcurrentQueue< T, EnqPolicy >::enqWait (T const & *item*)

Add a copy of item to the queue.

Parameters

<i>item</i>	Item to enqueue
-------------	-----------------

Add a copy of item to the queue. If the queue is full wait until it becomes non-full. This may throw any exception thrown by the assignment operator of type T, or badAlloc.

Definition at line 747 of file ConcurrentQueue.hh.

6.1.3.11 template<class T, class EnqPolicy > bool artdaq::ConcurrentQueue< T, EnqPolicy >::full () const

Return true if the queue is full, and false if it is not.

Returns

True if the queue is full

Definition at line 821 of file ConcurrentQueue.hh.

6.1.3.12 template<class T, class EnqPolicy = FailIfFull<T>> std::chrono::steady_clock::time_point artdaq::ConcurrentQueue< T, EnqPolicy >::getReadyTime () const [inline]

Gets the time at which the queue became ready.

Returns

Time at which the queue became ready

Definition at line 618 of file ConcurrentQueue.hh.

6.1.3.13 template<class T, class EnqPolicy> detail::MemoryType artdaq::ConcurrentQueue< T, EnqPolicy >::memory () const

Return the memory of the queue in bytes, that is, the maximum memory the items in the queue may occupy.

Returns

The amount of memory allocated by the queue

Definition at line 863 of file ConcurrentQueue.hh.

6.1.3.14 template<class T, class EnqPolicy = FailIfFull<T>> bool artdaq::ConcurrentQueue< T, EnqPolicy >::queueReaderIsReady () const [inline]

Is the reader connected and ready for items to appear on the queue?

Returns

If the reader is connected and ready for items to be written to the queue.

Definition at line 599 of file ConcurrentQueue.hh.

6.1.3.15 template<class T, class EnqPolicy> bool artdaq::ConcurrentQueue< T, EnqPolicy >::setCapacity (SizeType capacity)

Reset the capacity of the queue. This can only be done if the queue is empty. This function returns false if the queue was not modified, and true if it was modified.

Parameters

capacity	The new capacity of the queue
----------	-------------------------------

Returns

True if the queue was modified

Definition at line 845 of file ConcurrentQueue.hh.

6.1.3.16 template<class T, class EnqPolicy> bool artdaq::ConcurrentQueue< T, EnqPolicy >::setMemory (detail::MemoryType maxMemory)

Reset the memory usage in bytes of the queue. A value of 0 disabled the memory check. This can only be done if the queue is empty.

Parameters

<i>maxMemory</i>	Sets the maximum amount of memory used by the queue
------------------	---

Returns

This function returns false if the queue was not modified, and true if it was modified.

Definition at line 871 of file ConcurrentQueue.hh.

6.1.3.17 template<class T, class EnqPolicy = FailIfFull<T>> void artdaq::ConcurrentQueue< T, EnqPolicy >::setReaderIsReady (bool *rdy* = true) [inline]

Set the ready flag for the reader.

Parameters

<i>rdy</i>	Value of the ready flag (default: true)
------------	---

Sets the ready flag for the reader, and the time that the reader became ready or unready. Used to help *artdaq* wait for *art* to finish initializing.

Definition at line 608 of file ConcurrentQueue.hh.

6.1.3.18 template<class T, class EnqPolicy > ConcurrentQueue< T, EnqPolicy >::SizeType artdaq::ConcurrentQueue< T, EnqPolicy >::size () const

Return the size of the queue, that is, the number of items it contains.

Returns

The number of items in the queue

Definition at line 829 of file ConcurrentQueue.hh.

6.1.3.19 template<class T, class EnqPolicy > detail::MemoryType artdaq::ConcurrentQueue< T, EnqPolicy >::used () const

Return the memory in bytes used by items in the queue.

Returns

The amount of memory in use by queue items

Definition at line 855 of file ConcurrentQueue.hh.

The documentation for this class was generated from the following file:

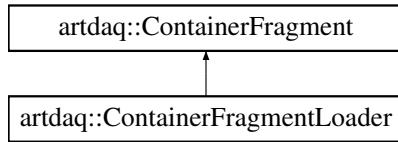

- artdaq-core/artdaq-core/Core/ConcurrentQueue.hh

6.2 artdaq::ContainerFragment Class Reference

The [ardaq::ContainerFragment](#) class represents a [Fragment](#) which contains other Fragments.

```
#include <artdaq-core/Data/ContainerFragment.hh>
```

Inheritance diagram for artdaq::ContainerFragment:

Classes

- struct [Metadata](#)

Contains the information necessary for retrieving [Fragment](#) objects from the [ContainerFragment](#).

Public Member Functions

- [ContainerFragment \(Fragment const &f\)](#)

- [Metadata const * metadata \(\) const](#)

const getter function for the [Metadata](#)

- [Metadata::count_t block_count \(\) const](#)

Gets the number of fragments stored in the [ContainerFragment](#).

- [Fragment::type_t fragment_type \(\) const](#)

Get the [Fragment::type_t](#) of stored [Fragment](#) objects.

- [bool missing_data \(\) const](#)

Gets the flag if the [ContainerFragment](#) knows that it is missing data.

- [void const * dataBegin \(\) const](#)

Gets the start of the data.

- [void const * dataEnd \(\) const](#)

Gets the last [Fragment](#) in the [ContainerFragment](#).

- [FragmentPtr at \(size_t index\) const](#)

Gets a specific [Fragment](#) from the [ContainerFragment](#).

- [size_t fragSize \(size_t index\) const](#)

Gets the size of the [Fragment](#) at the specified location in the [ContainerFragment](#), in bytes.

- [FragmentPtr operator\[\] \(size_t index\) const](#)

Alias to [ContainerFragment::at\(\)](#)

- [size_t fragmentIndex \(size_t index\) const](#)

Get the offset of a [Fragment](#) within the [ContainerFragment](#).

- [size_t lastFragmentIndex \(\) const](#)

Returns the offset of the last [Fragment](#) in the [ContainerFragment](#).

Static Protected Member Functions

- static constexpr size_t [words_per_frag_word_ \(\)](#)

Gets the ratio between the fundamental data storage type and the representation within the [Fragment](#).

6.2.1 Detailed Description

The `artdaq::ContainerFragment` class represents a `Fragment` which contains other Fragments.

Definition at line 30 of file ContainerFragment.hh.

6.2.2 Constructor & Destructor Documentation

6.2.2.1 `artdaq::ContainerFragment::ContainerFragment (Fragment const & f) [inline], [explicit]`

Parameters

<code>f</code>	The <code>Fragment</code> object to use for data storage
----------------	--

The constructor simply sets its const private member "artdaq_Fragment_" to refer to the `artdaq::Fragment` object

Definition at line 61 of file ContainerFragment.hh.

6.2.3 Member Function Documentation

6.2.3.1 `FragmentPtr artdaq::ContainerFragment::at (size_t index) const [inline]`

Gets a specific `Fragment` from the `ContainerFragment`.

Parameters

<code>index</code>	The <code>Fragment</code> index to return
--------------------	---

Returns

Pointer to the specified `Fragment` in the `ContainerFragment`

Exceptions

<code>cet::exception</code>	if the index is out-of-range
-----------------------------	------------------------------

Definition at line 109 of file ContainerFragment.hh.

6.2.3.2 `Metadata::count_t artdaq::ContainerFragment::block_count () const [inline]`

Gets the number of fragments stored in the `ContainerFragment`.

Returns

The number of `Fragment` objects stored in the `ContainerFragment`

Definition at line 73 of file ContainerFragment.hh.

6.2.3.3 `void const* artdaq::ContainerFragment::dataBegin () const [inline]`

Gets the start of the data.

Returns

Pointer to the first `Fragment` in the `ContainerFragment`

Definition at line 89 of file ContainerFragment.hh.

6.2.3.4 void const* artdaq::ContainerFragment::dataEnd() const [inline]

Gets the last [Fragment](#) in the [ContainerFragment](#).

Returns

Pointer to the last [Fragment](#) in the [ContainerFragment](#)

Definition at line 98 of file ContainerFragment.hh.

6.2.3.5 Fragment::type_t artdaq::ContainerFragment::fragment_type() const [inline]

Get the [Fragment::type_t](#) of stored [Fragment](#) objects.

Returns

The [Fragment::type_t](#) of stored [Fragment](#) objects

Definition at line 78 of file ContainerFragment.hh.

6.2.3.6 size_t artdaq::ContainerFragment::fragmentIndex(size_t index) const [inline]

Get the offset of a [Fragment](#) within the [ContainerFragment](#).

Parameters

<i>index</i>	The Fragment index
--------------	------------------------------------

Returns

The offset of the requested [Fragment](#) within the [ContainerFragment](#)

Exceptions

<i>cet::exception</i>	if the index is out-of-range
-----------------------	------------------------------

Definition at line 154 of file ContainerFragment.hh.

6.2.3.7 size_t artdaq::ContainerFragment::fragSize(size_t index) const [inline]

Gets the size of the [Fragment](#) at the specified location in the [ContainerFragment](#), in bytes.

Parameters

<i>index</i>	The Fragment index
--------------	------------------------------------

Returns

The size of the [Fragment](#) at the specified location in the [ContainerFragment](#), in bytes

Exceptions

<i>cet::exception</i>	if the index is out-of-range
-----------------------	------------------------------

Definition at line 126 of file ContainerFragment.hh.

6.2.3.8 size_t artdaq::ContainerFragment::lastFragmentIndex () const [inline]

Returns the offset of the last [Fragment](#) in the [ContainerFragment](#).

Returns

The offset of the last [Fragment](#) in the [ContainerFragment](#)

Definition at line 168 of file ContainerFragment.hh.

6.2.3.9 Metadata const* artdaq::ContainerFragment::metadata () const [inline]

const getter function for the [Metadata](#)

Returns

const pointer to the [Metadata](#)

Definition at line 67 of file ContainerFragment.hh.

6.2.3.10 bool artdaq::ContainerFragment::missing_data () const [inline]

Gets the flag if the [ContainerFragment](#) knows that it is missing data.

Returns

The flag if the [ContainerFragment](#) knows that it is missing data

Definition at line 83 of file ContainerFragment.hh.

6.2.3.11 FragmentPtr artdaq::ContainerFragment::operator[](size_t index) const [inline]

Alias to [ContainerFragment::at\(\)](#)

Parameters

<i>index</i>	The Fragment index to return
--------------	--

Returns

Pointer to the specified [Fragment](#) in the [ContainerFragment](#)

Exceptions

<i>cet::exception</i>	if the index is out-of-range
-----------------------	------------------------------

Definition at line 143 of file ContainerFragment.hh.

6.2.3.12 static constexpr size_t artdaq::ContainerFragment::words_per_frag_word_ () [inline], [static], [protected]

Gets the ratio between the fundamental data storage type and the representation within the [Fragment](#).

Returns

The ratio between the fundamental data storage type and the representation within the [Fragment](#)

Definition at line 179 of file ContainerFragment.hh.

The documentation for this class was generated from the following file:

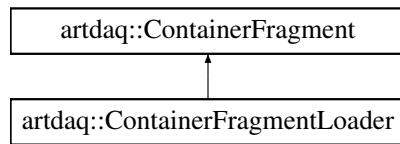

- artdaq-core/artdaq-core/Data/ContainerFragment.hh

6.3 artdaq::ContainerFragmentLoader Class Reference

A Read-Write version of the [ContainerFragment](#), used for filling [ContainerFragment](#) objects with other [Fragment](#) objects.

```
#include <artdaq-core/Data/ContainerFragmentLoader.hh>
```

Inheritance diagram for artdaq::ContainerFragmentLoader:

Public Member Functions

- [ContainerFragmentLoader \(Fragment &f, Fragment::type_t expectedFragmentType\)](#)
Constructs the ContainerFragmentLoader.
- [Metadata * metadata \(\)](#)
Get the ContainerFragment metadata (includes information about the location of Fragment objects within the ContainerFragment)
- [void set_fragment_type \(Fragment::type_t type\)](#)
Sets the type of Fragment which this ContainerFragment should contain.
- [void set_missing_data \(bool isDataMissing\)](#)
Sets the missing_data flag.
- [void addFragment \(artdaq::Fragment &frag\)](#)
Add a Fragment to the ContainerFragment by reference.
- [void addFragment \(artdaq::FragmentPtr &frag\)](#)
Add a Fragment to the ContainerFragment by smart pointer.
- [void addFragments \(artdaq::FragmentPtrs &frags\)](#)
Add a collection of Fragment objects to the ContainerFragment.

Additional Inherited Members

6.3.1 Detailed Description

A Read-Write version of the [ContainerFragment](#), used for filling [ContainerFragment](#) objects with other [Fragment](#) objects.
Definition at line 28 of file ContainerFragmentLoader.hh.

6.3.2 Constructor & Destructor Documentation

6.3.2.1 artdaq::ContainerFragmentLoader::ContainerFragmentLoader (artdaq::Fragment & f, Fragment::type_t expectedFragmentType = Fragment::EmptyFragmentType) [inline], [explicit]

Constructs the [ContainerFragmentLoader](#).

Parameters

<i>f</i>	A Fragment object containing a Fragment header.
<i>expectedFragmentType</i>	The type of fragment which will be put into this ContainerFragment

Exceptions

<i>cet::exception</i>	if the Fragment input has inconsistent Header information
-----------------------	---

Definition at line 105 of file ContainerFragmentLoader.hh.

6.3.3 Member Function Documentation

6.3.3.1 void artdaq::ContainerFragmentLoader::addFragment (artdaq::Fragment & frag) [inline]

Add a [Fragment](#) to the [ContainerFragment](#) by reference.

Parameters

<i>frag</i>	A Fragment object to be added to the ContainerFragment
-------------	--

Exceptions

<i>cet::exception</i>	If the Fragment to be added has a different type than expected
-----------------------	--

Definition at line 146 of file ContainerFragmentLoader.hh.

6.3.3.2 void artdaq::ContainerFragmentLoader::addFragment (artdaq::FragmentPtr & frag) [inline]

Add a [Fragment](#) to the [ContainerFragment](#) by smart pointer.

Parameters

<i>frag</i>	A FragmentPtr to a Fragment to be added to the ContainerFragment
-------------	--

Definition at line 173 of file ContainerFragmentLoader.hh.

6.3.3.3 void artdaq::ContainerFragmentLoader::addFragments(artdaq::FragmentPtrs & frags) [inline]

Add a collection of [Fragment](#) objects to the [ContainerFragment](#).

Parameters

<code>frags</code>	An <code>artdaq::FragmentPtrs</code> object containing Fragments to be added to the <code>ContainerFragment</code>
--------------------	--

Definition at line 178 of file ContainerFragmentLoader.hh.

6.3.3.4 Metadata* artdaq::ContainerFragmentLoader::metadata() [inline]

Get the `ContainerFragment` metadata (includes information about the location of `Fragment` objects within the `ContainerFragment`)

Returns

The `ContainerFragment` metadata

Definition at line 46 of file ContainerFragmentLoader.hh.

6.3.3.5 void artdaq::ContainerFragmentLoader::set_fragment_type(Fragment::type_t type) [inline]

Sets the type of `Fragment` which this `ContainerFragment` should contain.

Parameters

<code>type</code>	The <code>Fragment::type_t</code> identifying the type of <code>Fragment</code> objects stored in this <code>ContainerFragment</code>
-------------------	---

Definition at line 56 of file ContainerFragmentLoader.hh.

6.3.3.6 void artdaq::ContainerFragmentLoader::set_missing_data(bool isDataMissing) [inline]

Sets the missing_data flag.

Parameters

<code>isDataMissing</code>	The value of the missing_data flag
----------------------------	------------------------------------

The `ContainerFragment::Metadata::missing_data` flag is used for FragmentGenerators to indicate that the fragment is incomplete, but the generator does not have the correct data to fill it. This happens for Window-mode FragmentGenerators when the window requested is before the start of the `FragmentGenerator`'s buffers, for example.

Definition at line 69 of file ContainerFragmentLoader.hh.

The documentation for this class was generated from the following file:

- artdaq-core/artdaq-core/Data/ContainerFragmentLoader.hh

6.4 artdaq::FailIfFull< T > Struct Template Reference

`ConcurrentQueue` policy to throw an exception when the queue is full.

```
#include <artdaq-core/Core/ConcurrentQueue.hh>
```

Classes

- struct `QueueIsFull`

Exception thrown by `FailIfFull` policy when an enqueue operation is attempted on a full queue.

Public Types

- **typedef bool ReturnType**
Type returned by doEnq.
- **typedef T ValueType**
Type of values stored in queue.
- **typedef std::list< T > SequenceType**
Type of sequences of values.
- **typedef SequenceType::size_type SizeType**
Size type of sequences.

Static Public Member Functions

- **static void doInsert (T const &item, SequenceType &elements, SizeType &size, detail::MemoryType const &itemSize, detail::MemoryType &used, std::condition_variable &nonempty)**
Inserts element into the ConcurrentQueue.
- **static ReturnType doEnq (T const &item, SequenceType &elements, SizeType &size, SizeType &capacity, detail::MemoryType &used, detail::MemoryType &memory, size_t &elementDropped, std::condition_variable &nonempty)**
Attempts to enqueue an item.

Static Public Attributes

- **artdaq::FailIfFull::QueuelsFull queueIsFull {}**
Instance of QueueIsFull exception.

6.4.1 Detailed Description

template<class T>struct artdaq::FailIfFull< T >

ConcurrentQueue policy to throw an exception when the queue is full.

Template Parameters

<i>T</i>	Type of element to store in queue
----------	-----------------------------------

Definition at line 160 of file ConcurrentQueue.hh.

6.4.2 Member Function Documentation

- 6.4.2.1 template<class T > static ReturnType artdaq::FailIfFull< T >::doEnq (T const & item, SequenceType & elements, SizeType & size, SizeType & capacity, detail::MemoryType & used, detail::MemoryType & memory, size_t & elementsDropped, std::condition_variable & nonempty) [inline], [static]

Attempts to enqueue an item.

Parameters

<i>item</i>	Item to enqueue
<i>elements</i>	The ConcurrentQueue data
<i>size</i>	Number of elements in the ConcurrentQueue
<i>capacity</i>	Maximum number of elements in the ConcurrentQueue
<i>used</i>	Memory used by the ConcurrentQueue elements
<i>memory</i>	Amount of memory available for use by the ConcurrentQueue
<i>elements-Dropped</i>	Number of failed insert operations
<i>nonempty</i>	Condition variable to notify readers of new data on the queue

Returns

Whether the enqueue operation succeeded

Exceptions

<i>queueIsFull</i>	if the queue is full
--------------------	----------------------

Definition at line 222 of file [ConcurrentQueue.hh](#).

6.4.2.2 template<class T > static void artdaq::FailIfFull< T >::doInsert (T const & *item*, SequenceType & *elements*, SizeType & *size*, detail::MemoryType const & *itemSize*, detail::MemoryType & *used*, std::condition_variable & *nonempty*) [inline], [static]

Inserts element into the [ConcurrentQueue](#).

Parameters

<i>item</i>	Item to insert
<i>elements</i>	The ConcurrentQueue data
<i>size</i>	Number of elements in the ConcurrentQueue
<i>itemSize</i>	Size of the newly-inserted element
<i>used</i>	Memory used by the ConcurrentQueue elements
<i>nonempty</i>	Condition variable to notify readers of new data on queue

Definition at line 193 of file [ConcurrentQueue.hh](#).

The documentation for this struct was generated from the following file:

- [artdaq-core/artdaq-core/Core/ConcurrentQueue.hh](#)

6.5 artdaq::Fragment Class Reference

A [Fragment](#) contains the data from one piece of the DAQ system for one event. The [artdaq::Fragment](#) is the main data storage class in artdaq. Each [Fragment](#) represents the data from one piece of the readout, for one artdaq event. BoardReaders create Fragments and send them to the EventBuilders, where they are assembled into [artdaq::RawEvent](#) objects.

```
#include <artdaq-core/Data/Fragment.hh>
```

Public Types

- [typedef uint8_t byte_t](#)

For byte representation.

- `typedef detail::RawFragmentHeader::version_t version_t`
typedef for version_t from RawFragmentHeader
- `typedef detail::RawFragmentHeader::type_t type_t`
typedef for type_t from RawFragmentHeader
- `typedef detail::RawFragmentHeader::sequence_id_t sequence_id_t`
typedef for sequence_id_t from RawFragmentHeader
- `typedef detail::RawFragmentHeader::fragment_id_t fragment_id_t`
typedef for fragment_id_t from RawFragmentHeader
- `typedef detail::RawFragmentHeader::timestamp_t timestamp_t`
typedef for timestamp_t from RawFragmentHeader
- `typedef QuickVec< RawDataType > ::reference reference`
Alias reference type from QuickVec<RawDataType>
- `typedef QuickVec< RawDataType > ::iterator iterator`
Alias iterator type from QuickVec<RawDataType>
- `typedef QuickVec< RawDataType > ::const_iterator const_iterator`
Alias const_iterator type from QuickVec<RawDataType>
- `typedef QuickVec< RawDataType > ::value_type value_type`
Alias value_type type from QuickVec<RawDataType>
- `typedef QuickVec< RawDataType > ::difference_type difference_type`
Alias difference_type type from QuickVec<RawDataType>
- `typedef QuickVec< RawDataType > ::size_type size_type`
Alias size_type type from QuickVec<RawDataType>

Public Member Functions

- `Fragment ()`
Create a Fragment with all header values zeroed.
- `Fragment (const Fragment &)=default`
Default copy constructor.
- `Fragment (Fragment &&) noexcept`
Move Constructor.
- `Fragment & operator= (const Fragment &)=default`
Default copy-assignment operator.
- `Fragment & operator= (Fragment &&) noexcept`
Move-assignment operator.
- `Fragment (std::size_t n)`

- Create a [Fragment](#) ready to hold n words ([RawDataTypes](#)) of payload, and with all values zeroed.*
- template<class T >
`Fragment (std::size_t payload_size, sequence_id_t sequence_id, fragment_id_t fragment_id, type_t type, const T &metadata, timestamp_t timestamp=Fragment::InvalidTimestamp)`

Create a [Fragment](#) with the given header values.
 - `Fragment (sequence_id_t sequenceID, fragment_id_t fragID, type_t type=Fragment::DataFragmentType, timestamp_t timestamp=Fragment::InvalidTimestamp)`

Create a fragment with the given event id and fragment id, and with no data payload.
 - `void print (std::ostream &os) const`

Print out summary information for this [Fragment](#) to the given stream.
 - `std::size_t size () const`

Gets the size of the [Fragment](#), from the [Fragment](#) header.
 - `version_t version () const`

Version of the [Fragment](#), from the [Fragment](#) header.
 - `type_t type () const`

Type of the [Fragment](#), from the [Fragment](#) header.
 - `std::string typeString () const`

Print the type of the [Fragment](#).
 - `sequence_id_t sequenceID () const`

Sequence ID of the [Fragment](#), from the [Fragment](#) header.
 - `fragment_id_t fragmentID () const`

Fragment ID of the [Fragment](#), from the [Fragment](#) header.
 - `timestamp_t timestamp () const`

Timestamp of the [Fragment](#), from the [Fragment](#) header.
 - `void setType (type_t utype)`

Sets the type of the [Fragment](#), checking that it is a valid user type.
 - `void setSystemType (type_t stype)`

Sets the type of the [Fragment](#), checking that it is a valid system type.
 - `void setSequenceID (sequence_id_t sequence_id)`

Sets the Sequence ID of the [Fragment](#).
 - `void setFragmentID (fragment_id_t fragment_id)`

Sets the [Fragment](#) ID of the [Fragment](#).
 - `void setTimestamp (timestamp_t timestamp)`

Sets the Timestamp of the [Fragment](#).
 - `std::size_t sizeBytes () const`

Size of vals_ vector (header + (optional) metadata + payload) in bytes.
 - `std::size_t dataSize () const`

Return the number of [RawDataTypes](#) words in the data payload. This does not include the number of words in the header or the metadata.
 - `std::size_t dataSizeBytes () const`

Return the number of bytes in the data payload. This does not include the number of bytes in the header or the metadata.
 - `bool hasMetadata () const`

Test whether this [Fragment](#) has metadata.
 - template<class T >
`T * metadata ()`

Return a pointer to the metadata. This throws an exception if the [Fragment](#) contains no metadata.
 - template<class T >
`T const * metadata () const`

Return a const pointer to the metadata. This throws an exception if the [Fragment](#) contains no metadata.

- template<class T >
void [setMetadata](#) (const T &md)

Set the metadata in the [Fragment](#) to the contents of the specified structure. This throws an exception if the [Fragment](#) already contains metadata.

- template<class T >
void [updateMetadata](#) (const T &md)

Updates existing metadata with a new metadata object.

- void [resize](#) (std::size_t sz)

Resize the data payload to hold sz RawDataType words.

- void [resize](#) (std::size_t sz, [RawDataType](#) val)

Resize the data payload to hold sz RawDataType words. Initialize new elements (if any) with val.

- void [resizeBytes](#) (std::size_t szbytes)

Resize the data payload to hold szbytes bytes (padded by the 8-byte RawDataTypes, so, e.g., requesting 14 bytes will actually get you 16)

- void [resizeBytes](#) (std::size_t szbytes, [byte_t](#) val)

Resize the data payload to hold sz bytes (padded by the 8-byte RawDataTypes, so, e.g., requesting 14 bytes will actually get you 16). Initialize new elements (if any) with val.

- void [autoResize](#) ()

Resize the fragment to hold the number of words indicated by the header.

- iterator [dataBegin](#) ()

Return an iterator to the beginning of the data payload (after header and metadata)

- iterator [dataEnd](#) ()

Return an iterator to the end of the data payload.

- template<typename T >

T [reinterpret_cast_checked](#) (const [RawDataType](#) *in) const

Wrapper around reinterpret_cast.

- template<typename T >

T [reinterpret_cast_checked](#) ([RawDataType](#) *in)

Wrapper around reinterpret_cast.

- [byte_t](#) * [dataBeginBytes](#) ()

Return [Fragment::byte_t](#) pointing at the beginning of the payload.*

- [byte_t](#) * [dataEndBytes](#) ()

Return [Fragment::byte_t](#) pointing at the end of the payload.*

- iterator [headerBegin](#) ()

Return an iterator to the beginning of the header (should be used for serialization only: use setters for preference).

- [byte_t](#) * [headerBeginBytes](#) ()

Return a [Fragment::byte_t](#) pointer pointing to the beginning of the header.

- const_iterator [dataBegin](#) () const

Returns a const_iterator to the beginning of the data payload.

- const_iterator [dataEnd](#) () const

Returns a const_iterator to the end of the data payload.

- const [byte_t](#) * [dataBeginBytes](#) () const

Return const [Fragment::byte_t](#) pointing at the beginning of the payload.*

- const [byte_t](#) * [dataEndBytes](#) () const

Return const [Fragment::byte_t](#) pointing at the end of the payload.*

- const_iterator [headerBegin](#) () const

Return an const_iterator to the beginning of the header (should be used for serialization only: use setters for preference).

- const `byte_t * headerBeginBytes () const`
Return a const `Fragment::byte_t` pointer pointing to the beginning of the header.
- void `clear ()`
Removes all elements from the payload section of the `Fragment`.
- bool `empty ()`
Determines if the `Fragment` contains no data.
- void `reserve (std::size_t cap)`
Reserves enough memory to hold cap `RawDataType` words in the `Fragment` payload.
- void `swap (Fragment &other) noexcept`
Swaps two `Fragment` objects.
- void `swap (QuickVec< RawDataType > &other) noexcept`
Swaps two `Fragment` data vectors.
- `RawDataType * dataAddress ()`
Returns a `RawDataType` pointer to the beginning of the payload.
- `RawDataType * metadataAddress ()`
Get the address of the metadata. For internal use only, use `metadata()` instead.
- `RawDataType * headerAddress ()`
Gets the address of the header.

Static Public Member Functions

- static constexpr bool `isUserFragmentType (type_t fragmentType)`
Returns whether the given type is in the range of user types.
- static constexpr bool `isSystemFragmentType (type_t fragmentType)`
Returns whether the given type is in the range of system types.
- static std::map< `type_t`,
`std::string` > `MakeSystemTypeMap ()`
Returns a map of the most commonly-used system types.
- static `FragmentPtr FragmentBytes (std::size_t nbytes)`
Create a `Fragment` using a static factory function rather than a constructor to allow for the function name "FragmentBytes".
- template<class T>
`static FragmentPtr FragmentBytes (std::size_t payload_size_in_bytes, sequence_id_t sequence_id, fragment_id_t fragment_id, type_t type, const T &metadata, timestamp_t timestamp=Fragment::InvalidTimestamp)`
Create a `Fragment` with the given header values. Uses static factory function instead of constructor to allow for the function name "FragmentBytes".
- static `FragmentPtr eodFrag (size_t nFragsToExpect)`
Creates an EndOfData `Fragment`.
- template<class InputIterator>
`static FragmentPtr dataFrag (sequence_id_t sequenceID, fragment_id_t fragID, InputIterator i, InputIterator e)`
Creates a `Fragment`, copying data from given location. 12-Apr-2013, KAB - this method is deprecated, please do not use (internal use only)
- static `FragmentPtr dataFrag (sequence_id_t sequenceID, fragment_id_t fragID, RawDataType const *dataPtr, size_t dataSize, timestamp_t timestamp=Fragment::InvalidTimestamp)`
Creates a `Fragment`, copying data from given location.

Static Public Attributes

- static constexpr `version_t InvalidVersion` = detail::RawFragmentHeader::InvalidVersion
Copy InvalidVersion from RawFragmentHeader.
- static constexpr `sequence_id_t InvalidSequenceID` = detail::RawFragmentHeader::InvalidSequenceID
Copy InvalidSequenceID from RawFragmentHeader.
- static constexpr `fragment_id_t InvalidFragmentID` = detail::RawFragmentHeader::InvalidFragmentID
Copy InvalidFragmentID from RawFragmentHeader.
- static constexpr `timestamp_t InvalidTimestamp` = detail::RawFragmentHeader::InvalidTimestamp
Copy InvalidTimestamp from RawFragmentHeader.
- static constexpr `type_t InvalidFragmentType` = detail::RawFragmentHeader::InvalidFragmentType
Copy InvalidFragmentType from RawFragmentHeader.
- static constexpr `type_t EndOfDataFragmentType` = detail::RawFragmentHeader::EndOfDataFragmentType
Copy EndOfDataFragmentType from RawFragmentHeader.
- static constexpr `type_t DataFragmentType` = detail::RawFragmentHeader::DataFragmentType
Copy DataFragmentType from RawFragmentHeader.
- static constexpr `type_t InitFragmentType` = detail::RawFragmentHeader::InitFragmentType
Copy InitFragmentType from RawFragmentHeader.
- static constexpr `type_t EndOfRunFragmentType` = detail::RawFragmentHeader::EndOfRunFragmentType
Copy EndOfRunFragmentType from RawFragmentHeader.
- static constexpr `type_t EndOfSubrunFragmentType` = detail::RawFragmentHeader::EndOfSubrunFragmentType
Copy EndOfSubrunFragmentType from RawFragmentHeader.
- static constexpr `type_t ShutdownFragmentType` = detail::RawFragmentHeader::ShutdownFragmentType
Copy ShutdownFragmentType from RawFragmentHeader.
- static constexpr `type_t FirstUserFragmentType` = detail::RawFragmentHeader::FIRST_USER_TYPE
Copy FIRST_USER_TYPE from RawFragmentHeader.
- static constexpr `type_t EmptyFragmentType` = detail::RawFragmentHeader::EmptyFragmentType
Copy EmptyFragmentType from RawFragmentHeader.
- static constexpr `type_t ContainerFragmentType` = detail::RawFragmentHeader::ContainerFragmentType
Copy ContainerFragmentType from RawFragmentHeader.

6.5.1 Detailed Description

A `Fragment` contains the data from one piece of the DAQ system for one event. The `artdaq::Fragment` is the main data storage class in artdaq. Each `Fragment` represents the data from one piece of the readout, for one artdaq event. BoardReaders create `Fragment`s and send them to the EventBuilders, where they are assembled into `artdaq::RawEvent` objects.

Definition at line 84 of file Fragment.hh.

6.5.2 Member Typedef Documentation

6.5.2.1 `typedef uint8_t artdaq::Fragment::byte_t`

For byte representation.

JCF, 3/25/14 Add interface functions which allow users to work with the underlying data (a vector of `RawDataTypes`) in byte representation

Definition at line 99 of file Fragment.hh.

6.5.3 Constructor & Destructor Documentation

6.5.3.1 `artdaq::Fragment::Fragment (const Fragment &) [default]`

Default copy constructor.

Todo Decide if Copy constructor should be declared =delete

6.5.3.2 `artdaq::Fragment::Fragment (Fragment &&) [inline], [default], [noexcept]`

Move Constructor.

Separate declaration and definition of Move Constructor: <http://stackoverflow.com/questions/33939687>
 This should generate an exception if `artdaq::Fragment` is not move-constructible

6.5.3.3 `artdaq::Fragment::Fragment (std::size_t n) [explicit]`

Create a `Fragment` ready to hold n words (RawDataTypes) of payload, and with all values zeroed.

Parameters

<code>n</code>	The initial size of the <code>Fragment</code> , in RawDataType words
----------------	--

Definition at line 22 of file Fragment.cc.

6.5.3.4 `template<class T> artdaq::Fragment::Fragment (std::size_t payload_size, sequence_id_t sequence_id, fragment_id_t fragment_id, type_t type, const T & metadata, timestamp_t timestamp = Fragment::InvalidTimestamp)`

Create a `Fragment` with the given header values.

Template Parameters

<code>T</code>	Metadata type
----------------	---------------

Parameters

<code>payload_size</code>	Size of the payload in RawDataType words (<code>Fragment</code> size is header + metadata + payload)
<code>sequence_id</code>	Sequence ID of <code>Fragment</code>
<code>fragment_id</code>	<code>Fragment</code> ID of <code>Fragment</code>
<code>type</code>	Type of <code>Fragment</code>
<code>metadata</code>	Metadata object
<code>timestamp</code>	Timestamp of <code>Fragment</code>

Definition at line 767 of file Fragment.hh.

6.5.3.5 `artdaq::Fragment::Fragment (sequence_id_t sequenceID, fragment_id_t fragID, type_t type = Fragment::DataFragmentType, timestamp_t timestamp = Fragment::InvalidTimestamp)`

Create a fragment with the given event id and fragment id, and with no data payload.

Parameters

<i>sequenceID</i>	Sequence ID of Fragment
<i>fragID</i>	Fragment ID of Fragment
<i>type</i>	Type of Fragment
<i>timestamp</i>	Timestamp of Fragment

Definition at line 39 of file Fragment.cc.

6.5.4 Member Function Documentation

6.5.4.1 `artdaq::RawDataType * artdaq::Fragment::dataAddress() [inline]`

Returns a RawDataType pointer to the beginning of the payload.

Returns

A RawDataType pointer to the beginning of the payload

Definition at line 1101 of file Fragment.hh.

6.5.4.2 `artdaq::Fragment::iterator artdaq::Fragment::dataBegin() [inline]`

Return an iterator to the beginning of the data payload (after header and metadata)

Returns

iterator to the beginning of the data payload

Definition at line 1025 of file Fragment.hh.

6.5.4.3 `artdaq::Fragment::const_iterator artdaq::Fragment::dataBegin() const [inline]`

Returns a const_iterator to the beginning of the data payload.

Returns

A const_iterator to the beginning of the data payload

Definition at line 1047 of file Fragment.hh.

6.5.4.4 `byte_t* artdaq::Fragment::dataBeginBytes() [inline]`

Return [Fragment::byte_t*](#) pointing at the beginning of the payload.

Returns

byte_t pointer to beginning of data payload

JCF, 3/25/14 – one nice thing about returning a pointer rather than an iterator is that we don't need to take the address of the dereferenced iterator (e.g., via `&*dataBegin()`) to get ahold of the memory

Definition at line 522 of file Fragment.hh.

6.5.4.5 const byte_t* artdaq::Fragment::dataBeginBytes() const [inline]

Return const [Fragment::byte_t*](#) pointing at the beginning of the payload.

Returns

const byte_t pointer to beginning of data payload

JCF, 3/25/14 – one nice thing about returning a pointer rather than an iterator is that we don't need to take the address of the dereferenced iterator (e.g., via &*dataEnd()) to get ahold of the memory

Definition at line 567 of file Fragment.hh.

6.5.4.6 artdaq::Fragment::iterator artdaq::Fragment::dataEnd() [inline]

Return an iterator to the end of the data payload.

Returns

iterator to the end of the data payload

Definition at line 1033 of file Fragment.hh.

6.5.4.7 artdaq::Fragment::const_iterator artdaq::Fragment::dataEnd() const [inline]

Returns a const_iterator to the end of the data payload.

Returns

A const_iterator to the end of the data payload

Definition at line 1055 of file Fragment.hh.

6.5.4.8 byte_t* artdaq::Fragment::dataEndBytes() [inline]

Return [Fragment::byte_t*](#) pointing at the end of the payload.

Returns

byte_t pointer to end of data payload

JCF, 3/25/14 – one nice thing about returning a pointer rather than an iterator is that we don't need to take the address of the dereferenced iterator (e.g., via &*dataEnd()) to get ahold of the memory

Definition at line 532 of file Fragment.hh.

6.5.4.9 const byte_t* artdaq::Fragment::dataEndBytes() const [inline]

Return const [Fragment::byte_t*](#) pointing at the end of the payload.

Returns

```
const byte_t pointer to end of data payload
```

JCF, 3/25/14 – one nice thing about returning a pointer rather than an iterator is that we don't need to take the address of the dereferenced iterator (e.g., via `&*dataEnd()`) to get ahold of the memory

Definition at line 580 of file Fragment.hh.

6.5.4.10 template<class InputIterator > static FragmentPtr artdaq::Fragment::dataFrag (sequence_id_t sequenceID, fragment_id_t fragID, InputIterator i, InputIterator e) [inline], [static]

Creates a [Fragment](#), copying data from given location. 12-Apr-2013, KAB - this method is deprecated, please do not use (internal use only)

Template Parameters

<i>InputIterator</i>	Type of input iterator
----------------------	------------------------

Parameters

<i>sequenceID</i>	Sequence ID of new Fragment
<i>fragID</i>	Fragment ID of new Fragment
<i>i</i>	Beginning of input range
<i>e</i>	End of input range

Returns

```
FragmentPtr to created Fragment
```

Todo Change function access specifier to restrict access

Definition at line 669 of file Fragment.hh.

6.5.4.11 artdaq::FragmentPtr artdaq::Fragment::dataFrag (sequence_id_t sequenceID, fragment_id_t fragID, RawDataType const * dataPtr, size_t dataSize, timestamp_t timestamp = Fragment::InvalidTimestamp) [static]

Creates a [Fragment](#), copying data from given location.

Parameters

<i>sequenceID</i>	Sequence ID of new Fragment
<i>fragID</i>	Fragment ID of new Fragment
<i>dataPtr</i>	Pointer to data to store in Fragment
<i>dataSize</i>	Size of data to store in Fragment
<i>timestamp</i>	Timestamp of created Fragment

Returns

```
FragmentPtr to created Fragment
```

Definition at line 85 of file Fragment.cc.

6.5.4.12 std::size_t artdaq::Fragment::dataSize() const [inline]

Return the number of RawDataType words in the data payload. This does not include the number of words in the header or the metadata.

Returns

Number of RawDataType words in the payload section of the [Fragment](#)

Definition at line 894 of file Fragment.hh.

6.5.4.13 std::size_t artdaq::Fragment::dataSizeBytes() const [inline]

Return the number of bytes in the data payload. This does not include the number of bytes in the header or the metadata.

Returns

Definition at line 355 of file Fragment.hh.

6.5.4.14 bool artdaq::Fragment::empty() [inline]

Determines if the [Fragment](#) contains no data.

Returns

Whether the [Fragment](#)'s payload is empty

Definition at line 1078 of file Fragment.hh.

6.5.4.15 artdaq::FragmentPtr artdaq::Fragment::eodFrag(size_t nFragsToExpect) [static]

Creates an EndOfData [Fragment](#).

Parameters

<i>nFragsToExpect</i>	The number of Fragments the receiver should have at the end of data-taking
-----------------------	--

Returns

Pointer to created EndOfData [Fragment](#)

Definition at line 74 of file Fragment.cc.

6.5.4.16 static FragmentPtr artdaq::Fragment::FragmentBytes(std::size_t nbytes) [inline], [static]

Create a [Fragment](#) using a static factory function rather than a constructor to allow for the function name "Fragment-Bytes".

Parameters

<i>nbytes</i>	The initial size of the Fragment , in bytes
---------------	---

Returns

FragmentPtr to created [Fragment](#)

Definition at line 200 of file Fragment.hh.

6.5.4.17 template<class T > static FragmentPtr artdaq::Fragment::FragmentBytes (std::size_t *payload_size_in_bytes*, sequence_id_t *sequence_id*, fragment_id_t *fragment_id*, type_t *type*, const T & *metadata*, timestamp_t *timestamp* = Fragment::InvalidTimestamp) [inline], [static]

Create a [Fragment](#) with the given header values. Uses static factory function instead of constructor to allow for the function name "FragmentBytes".

Template Parameters

<i>T</i>	Metadata type
----------	---------------

Parameters

<i>payload_size_in_bytes</i>	Size of the payload in bytes (Fragment size is header + metadata + payload). Bytes will be rounded to the next factor of RawDataType / sizeof(char)
<i>sequence_id</i>	Sequence ID of Fragment
<i>fragment_id</i>	Fragment ID of Fragment
<i>type</i>	Type of Fragment
<i>metadata</i>	Metadata object
<i>timestamp</i>	Timestamp of Fragment

Returns

FragmentPtr to created [Fragment](#)

Definition at line 235 of file Fragment.hh.

6.5.4.18 artdaq::Fragment::fragment_id_t artdaq::Fragment::fragmentID () const [inline]

Fragment ID of the [Fragment](#), from the [Fragment](#) header.

Returns

Fragment ID of the [Fragment](#)

Definition at line 833 of file Fragment.hh.

6.5.4.19 bool artdaq::Fragment::hasMetadata () const [inline]

Test whether this [Fragment](#) has metadata.

Returns

If a metadata object has been set

Definition at line 902 of file Fragment.hh.

6.5.4.20 artdaq::RawDataType * artdaq::Fragment::headerAddress() [inline]

Gets the address of the header.

Returns

Pointer to the header's location within the vals_ vector

Definition at line 1121 of file Fragment.hh.

6.5.4.21 artdaq::Fragment::iterator artdaq::Fragment::headerBegin() [inline]

Return an iterator to the beginning of the header (should be used for serialization only: use setters for preference).

Returns

an iterator to the beginning of the header

Definition at line 1040 of file Fragment.hh.

6.5.4.22 artdaq::Fragment::const_iterator artdaq::Fragment::headerBegin() const [inline]

Return an const_iterator to the beginning of the header (should be used for serialization only: use setters for preference).

Returns

an const_iterator to the beginning of the header

Definition at line 1062 of file Fragment.hh.

6.5.4.23 byte_t* artdaq::Fragment::headerBeginBytes() [inline]

Return a [Fragment::byte_t](#) pointer pointing to the beginning of the header.

Returns

byte_t pointer to the beginning of the header

Definition at line 545 of file Fragment.hh.

6.5.4.24 const byte_t* artdaq::Fragment::headerBeginBytes() const [inline]

Return a const [Fragment::byte_t](#) pointer pointing to the beginning of the header.

Returns

const byte_t pointer to the beginning of the header

Definition at line 596 of file Fragment.hh.

6.5.4.25 bool constexpr artdaq::Fragment::isSystemFragmentType(type_t fragmentType) [inline], [static]

Returns whether the given type is in the range of system types.

Parameters

<i>fragmentType</i>	The type to test
---------------------	------------------

Returns

Whether the given type is in the range of system types

Definition at line 734 of file Fragment.hh.

6.5.4.26 bool constexpr artdaq::Fragment::isUserFragmentType(type_t *fragmentType*) [inline], [static]

Returns whether the given type is in the range of user types.

Parameters

<i>fragmentType</i>	The type to test
---------------------	------------------

Returns

Whether the given type is in the range of user types

Definition at line 724 of file Fragment.hh.

6.5.4.27 static std::map<type_t, std::string> artdaq::Fragment::MakeSystemTypeMap() [inline], [static]

Returns a map of the most commonly-used system types.

Returns

A std::map of the most commonly-used system types

Definition at line 175 of file Fragment.hh.

6.5.4.28 template<class T > T * artdaq::Fragment::metadata()

Return a pointer to the metadata. This throws an exception if the [Fragment](#) contains no metadata.

Template Parameters

<i>T</i>	Type of the metadata
----------	----------------------

Returns

Pointer to the metadata

Exceptions

<i>cet::exception</i>	if no metadata is present
-----------------------	---------------------------

Definition at line 909 of file Fragment.hh.

6.5.4.29 template<class T > T const * artdaq::Fragment::metadata() const

Return a const pointer to the metadata. This throws an exception if the [Fragment](#) contains no metadata.

Template Parameters

<i>T</i>	Type of the metadata
----------	----------------------

Returns

const Pointer to the metadata

Exceptions

<i>cet::exception</i>	if no metadata is present
-----------------------	---------------------------

Definition at line 923 of file Fragment.hh.

6.5.4.30 artdaq::RawDataType * artdaq::Fragment::metadataAddress() [inline]

Get the address of the metadata. For internal use only, use [metadata\(\)](#) instead.

Returns

Pointer to the metadata's location within the vals_ vector

Exceptions

<i>cet::exception</i>	if no metadata in Fragment
-----------------------	--

Todo Change function access specifier to restrict access

Definition at line 1109 of file Fragment.hh.

6.5.4.31 Fragment& artdaq::Fragment::operator=(const Fragment &) [default]

Default copy-assignment operator.

Returns

Reference to new [Fragment](#)

Todo Decide if copy-assignment operator should be declared =delete

6.5.4.32 artdaq::Fragment & artdaq::Fragment::operator=(Fragment &&) [inline], [default], [noexcept]

Move-assignment operator.

Returns

Reference to [Fragment](#)

Separate declaration and definition of Move Constructor: <http://stackoverflow.com/questions/33939687>
This should generate an exception if [artdaq::Fragment](#) is not move-constructible

6.5.4.33 void artdaq::Fragment::print(std::ostream & os) const

Print out summary information for this [Fragment](#) to the given stream.

Parameters

<i>os</i>	Stream to print to
-----------	--------------------

Definition at line 65 of file Fragment.cc.

6.5.4.34 template<typename T > T artdaq::Fragment::reinterpret_cast_checked (const RawDataType * *in*) const [inline]

Wrapper around reinterpret_cast.

Template Parameters

<i>T</i>	Type of output pointer
----------	------------------------

Parameters

<i>in</i>	input pointer
-----------	---------------

Returns

Pointer cast to type T

Exceptions

<i>cet::exception</i>	if new pointer does not point to same address as old pointer
-----------------------	--

JCF, 1/21/15 There's actually not an ironclad guarantee in the C++ standard that the pointer reinterpret_cast<> returns has the same address as the pointer that was casted. It IS tested in the artdaq-core test suite, but since any uncaught, unexpected behavior from reinterpret_cast could be disastrous, I've wrapped it in this function and added a check just to be completely safe.

Please note that for this const-version, you'll need the const- qualifier to the pointer you pass as a parameter (i.e., reinterpret_cast_checked<const PtrType*>, not reinterpret_cast_checked<PtrType*>)

Definition at line 474 of file Fragment.hh.

6.5.4.35 template<typename T > T artdaq::Fragment::reinterpret_cast_checked (RawDataType * *in*) [inline]

Wrapper around reinterpret_cast.

Template Parameters

<i>T</i>	Type of output pointer
----------	------------------------

Parameters

<i>in</i>	input pointer
-----------	---------------

Returns

Pointer cast to type T

Exceptions

<code>cet::exception</code>	if new pointer does not point to same address as old pointer
-----------------------------	--

JCF, 1/21/15 There's actually not an ironclad guarantee in the C++ standard that the pointer `reinterpret_cast<>` returns has the same address as the pointer that was casted. It IS tested in the artdaq-core test suite, but since any uncaught, unexpected behavior from `reinterpret_cast` could be disastrous, I've wrapped it in this function and added a check just to be completely safe.

Definition at line 502 of file Fragment.hh.

6.5.4.36 void artdaq::Fragment::reserve (std::size_t cap) [inline]

Reserves enough memory to hold cap RawDataType words in the [Fragment](#) payload.

Parameters

<code>cap</code>	The new capacity of the Fragment payload, in RawDataType words.
------------------	---

Definition at line 1086 of file Fragment.hh.

6.5.4.37 void artdaq::Fragment::resize (std::size_t sz) [inline]

Resize the data payload to hold sz RawDataType words.

Parameters

<code>sz</code>	The new size of the payload portion of the Fragment , in RawDataType words
-----------------	--

Definition at line 973 of file Fragment.hh.

6.5.4.38 void artdaq::Fragment::resize (std::size_t sz, RawDataType val) [inline]

Resize the data payload to hold sz RawDataType words. Initialize new elements (if any) with val.

Parameters

<code>sz</code>	The new size of the payload portion of the Fragment , in RawDataType words
<code>val</code>	Value with which to initialize any new elements

Definition at line 982 of file Fragment.hh.

6.5.4.39 void artdaq::Fragment::resizeBytes (std::size_t szbytes) [inline]

Resize the data payload to hold szbytes bytes (padded by the 8-byte RawDataTypes, so, e.g., requesting 14 bytes will actually get you 16)

Parameters

<code>szbytes</code>	The new size of the payload portion of the Fragment , in bytes
----------------------	--

Definition at line 990 of file Fragment.hh.

6.5.4.40 void artdaq::Fragment::resizeBytes (std::size_t szbytes, byte_t val) [inline]

Resize the data payload to hold sz bytes (padded by the 8-byte RawDataTypes, so, e.g., requesting 14 bytes will actually get you 16). Initialize new elements (if any) with val.

Parameters

<i>szbytes</i>	The new size of the payload portion of the Fragment , in bytes
<i>val</i>	Value with which to initialize any new elements

Definition at line 998 of file Fragment.hh.

6.5.4.41 artdaq::Fragment::sequence_id_t artdaq::Fragment::sequenceID () const [inline]

Sequence ID of the [Fragment](#), from the [Fragment](#) header.

Returns

Sequence ID of the [Fragment](#)

Definition at line 826 of file Fragment.hh.

6.5.4.42 void artdaq::Fragment::setFragmentID (fragment_id_t *fragment_id*) [inline]

Sets the [Fragment](#) ID of the [Fragment](#).

Parameters

<i>fragment_id</i>	The Fragment ID to set
--------------------	--

Definition at line 869 of file Fragment.hh.

6.5.4.43 template<class T > void artdaq::Fragment::setMetadata (const T & *md*)

Set the metadata in the [Fragment](#) to the contents of the specified structure. This throws an exception if the [Fragment](#) already contains metadata.

Template Parameters

<i>T</i>	Type of the metadata
----------	----------------------

Parameters

<i>md</i>	Metadata to store in Fragment
-----------	---

Exceptions

<i>cet::exception</i>	if metadata already present in Fragment
-----------------------	---

Definition at line 936 of file Fragment.hh.

6.5.4.44 void artdaq::Fragment::setSequenceID (sequence_id_t *sequence_id*) [inline]

Sets the Sequence ID of the [Fragment](#).

Parameters

<i>sequence_id</i>	The sequence ID to set
--------------------	------------------------

Definition at line 861 of file Fragment.hh.

6.5.4.45 void artdaq::Fragment::setSystemType (*type_t stype*) [inline]

Sets the type of the [Fragment](#), checking that it is a valid system type.

Parameters

<i>stype</i>	The System type to set
--------------	------------------------

Definition at line 854 of file Fragment.hh.

6.5.4.46 void artdaq::Fragment::setTimestamp (*timestamp_t timestamp*) [inline]

Sets the Timestamp of the [Fragment](#).

Parameters

<i>timestamp</i>	The Timestamp to set
------------------	----------------------

Definition at line 876 of file Fragment.hh.

6.5.4.47 void artdaq::Fragment::setUserType (*type_t utype*) [inline]

Sets the type of the [Fragment](#), checking that it is a valid user type.

Parameters

<i>utype</i>	The User type to set
--------------	----------------------

Definition at line 847 of file Fragment.hh.

6.5.4.48 std::size_t artdaq::Fragment::size () const [inline]

Gets the size of the [Fragment](#), from the [Fragment](#) header.

Returns

Number of words in the [Fragment](#). Includes header, metadata, and payload

Definition at line 798 of file Fragment.hh.

6.5.4.49 std::size_t artdaq::Fragment::sizeBytes () const [inline]

Size of vals_ vector (header + (optional) metadata + payload) in bytes.

Returns

The size of the [Fragment](#) in bytes, including header, metadata, and payload

Definition at line 340 of file Fragment.hh.

6.5.4.50 void artdaq::Fragment::swap (**Fragment & other**) [inline], [noexcept]

Swaps two [Fragment](#) objects.

Parameters

<i>other</i>	Fragment to swap with
--------------	-----------------------

Definition at line 1094 of file Fragment.hh.

6.5.4.51 void artdaq::Fragment::swap (QuickVec< RawDataType > & *other*) [inline], [noexcept]

Swaps two [Fragment](#) data vectors.

Parameters

<i>other</i>	The data vector to swap with
--------------	------------------------------

Since all [Fragment](#) header information is stored in the data vector, this is equivalent to swapping two [Fragment](#) objects

Definition at line 630 of file Fragment.hh.

6.5.4.52 artdaq::Fragment::timestamp_t artdaq::Fragment::timestamp () const [inline]

Timestamp of the [Fragment](#), from the [Fragment](#) header.

Returns

Timestamp of the [Fragment](#)

Definition at line 840 of file Fragment.hh.

6.5.4.53 artdaq::Fragment::type_t artdaq::Fragment::type () const [inline]

Type of the [Fragment](#), from the [Fragment](#) header.

Returns

Type of the [Fragment](#)

Definition at line 812 of file Fragment.hh.

6.5.4.54 std::string artdaq::Fragment::typeString () const [inline]

Print the type of the [Fragment](#).

Returns

String representation of the [Fragment](#) type. For system types, the name will be included in parentheses

Definition at line 819 of file Fragment.hh.

6.5.4.55 template<class T > void artdaq::Fragment::updateMetadata (const T & *md*)

Updates existing metadata with a new metadata object.

Template Parameters

<i>T</i>	Type of the metadata
----------	----------------------

Parameters

<i>md</i>	Metadata to set
-----------	-----------------

Exceptions

<i>cet::exception</i>	if no metadata stored in Fragment
<i>cet::exception</i>	if new metadata has different size than existing metadata

Definition at line 953 of file Fragment.hh.

6.5.4.56 artdaq::Fragment::version_t artdaq::Fragment::version() const [inline]

Version of the [Fragment](#), from the [Fragment](#) header.

Returns

Version of the [Fragment](#)

Definition at line 805 of file Fragment.hh.

The documentation for this class was generated from the following files:

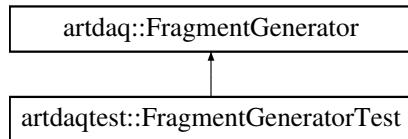

- artdaq-core/artdaq-core/Data/Fragment.hh
- artdaq-core/artdaq-core/Data/Fragment.cc

6.6 artdaq::FragmentGenerator Class Reference

Base class for all FragmentGenerators.

```
#include <artdaq-core/Generators/FragmentGenerator.hh>
```

Inheritance diagram for artdaq::FragmentGenerator:

Public Member Functions

- [FragmentGenerator \(\)=default](#)
Default Constructor.
- [virtual ~FragmentGenerator \(\)=default](#)
Default Destructor.
- [virtual bool getNext \(FragmentPtrs &output\)=0](#)
Obtain the next collection of Fragments.

- virtual std::vector<Fragment::fragment_id_t> fragmentIDs ()=0
Which fragment IDs does this FragmentGenerator generate?

6.6.1 Detailed Description

Base class for all FragmentGenerators.

[FragmentGenerator](#) is an abstract class that defines the interface for obtaining events in artdaq. Subclasses are to override the (private) virtual functions; users of [FragmentGenerator](#) are to invoke the public (non-virtual) functions.

Definition at line 25 of file FragmentGenerator.hh.

6.6.2 Member Function Documentation

6.6.2.1 virtual std::vector<Fragment::fragment_id_t> artdaq::FragmentGenerator::fragmentIDs () [pure virtual]

Which fragment IDs does this [FragmentGenerator](#) generate?

Returns

A std::vector of fragment_id_t

Each [FragmentGenerator](#) is responsible for one or more [Fragment](#) IDs. [Fragment](#) IDs should be unique in an event, and consistent for a given piece of hardware.

Implemented in [artdaqtest::FragmentGeneratorTest](#).

6.6.2.2 virtual bool artdaq::FragmentGenerator::getNext (FragmentPtrs & output) [pure virtual]

Obtain the next collection of Fragments.

Parameters

<i>output</i>	New FragmentPtr objects will be added to this FragmentPtrs object.
---------------	--

Returns

False indicates end-of-data

Obtain the next collection of Fragments. Return false to indicate end-of-data. Fragments may or may not be in the same event; Fragments may or may not have the same FragmentID. Fragments will all be part of the same Run and SubRun.

Implemented in [artdaqtest::FragmentGeneratorTest](#).

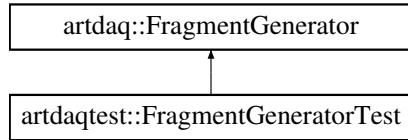

The documentation for this class was generated from the following file:

- artdaq-core/artdaq-core/Generators/FragmentGenerator.hh

6.7 artdaqtest::FragmentGeneratorTest Class Reference

Tests the functionality of the [artdaq::FragmentGenerator](#) class.

Inheritance diagram for artdaqtest::FragmentGeneratorTest:

Public Member Functions

- bool [getNext \(artdaq::FragmentPtrs &output\)](#) override
Obtain the next collection of Fragments.
- std::vector<>
<[artdaq::Fragment::fragment_id_t](#)> [fragmentIDs \(\)](#) override
Which fragment IDs does this FragmentGenerator generate?

6.7.1 Detailed Description

Tests the functionality of the [artdaq::FragmentGenerator](#) class.

Definition at line 15 of file FragmentGenerator_t.cc.

6.7.2 Member Function Documentation

6.7.2.1 std::vector<artdaq::Fragment::fragment_id_t> artdaqtest::FragmentGeneratorTest::fragmentIDs () [inline], [override], [virtual]

Which fragment IDs does this FragmentGenerator generate?

Returns

A std::vector of fragment_id_t

Each FragmentGenerator is responsible for one or more Fragment IDs. Fragment IDs should be unique in an event, and consistent for a given piece of hardware.

Implements [artdaq::FragmentGenerator](#).

Definition at line 26 of file FragmentGenerator_t.cc.

6.7.2.2 bool artdaqtest::FragmentGeneratorTest::getNext (artdaq::FragmentPtrs & output) [inline], [override], [virtual]

Obtain the next collection of Fragments.

Parameters

<i>output</i>	New FragmentPtr objects will be added to this FragmentPtrs object.
---------------	--

Returns

- False indicates end-of-data

Obtain the next collection of Fragments. Return false to indicate end-of-data. Fragments may or may not be in the same event; Fragments may or may not have the same FragmentID. Fragments will all be part of the same Run and SubRun.

Implements [artdaq::FragmentGenerator](#).

Definition at line 21 of file FragmentGenerator_t.cc.

The documentation for this class was generated from the following file:

- artdaq-core/test/Generators/FragmentGenerator_t.cc

6.8 artdaqcore::GetPackageBuildInfo Struct Reference

Wrapper around the [artdaqcore::GetPackageBuildInfo::getPackageBuildInfo](#) function.

```
#include <artdaq-core/BuildInfo/GetPackageBuildInfo.hh>
```

Static Public Member Functions

- static [artdaq::PackageBuildInfo getPackageBuildInfo \(\)](#)
Gets the version number and build timestamp for artdaq_core.

6.8.1 Detailed Description

Wrapper around the [artdaqcore::GetPackageBuildInfo::getPackageBuildInfo](#) function.

Definition at line 15 of file GetPackageBuildInfo.hh.

6.8.2 Member Function Documentation

6.8.2.1 static artdaq::PackageBuildInfo artdaqcore::GetPackageBuildInfo::getPackageBuildInfo () [static]

Gets the version number and build timestamp for artdaq_core.

Returns

An [artdaq::PackageBuildInfo](#) object containing the version number and build timestamp for artdaq_core

The documentation for this struct was generated from the following file:

- artdaq-core/artdaq-core/BuildInfo/GetPackageBuildInfo.hh

6.9 artdaq::detail::hasMemoryUsed< T > Class Template Reference

```
#include <artdaq-core/Core/ConcurrentQueue.hh>
```

Static Public Attributes

- static const bool **value** = (sizeof(test<T>(nullptr)) == sizeof(TrueType))

Use SFINAE to figure out if the class used to instantiate the [ConcurrentQueue](#) template has a method `memoryUsed` returning the number of bytes occupied by the class itself.

6.9.1 Detailed Description

```
template<typename T>class artdaq::detail::hasMemoryUsed< T >
```

This template is using SFINAE to figure out if the class used to instantiate the [ConcurrentQueue](#) template has a method `memoryUsed` returning the number of bytes occupied by the class itself.

Definition at line 71 of file `ConcurrentQueue.hh`.

The documentation for this class was generated from the following file:

- `artdaq-core/artdaq-core/Core/ConcurrentQueue.hh`

6.10 artdaq::KeepNewest< T > Struct Template Reference

[ConcurrentQueue](#) policy to discard oldest elements when the queue is full.

```
#include <artdaq-core/Core/ConcurrentQueue.hh>
```

Public Types

- **typedef std::pair< T, size_t > ValueType**
Type of elements stored in the queue.
- **typedef std::list< T > SequenceType**
Type of sequences of items.
- **typedef SequenceType::size_type SizeType**
Size type of sequences.
- **typedef SizeType ReturnType**
Type returned by `doEnq`.

Static Public Member Functions

- **static void doInsert (T const &item, SequenceType &elements, SizeType &size, detail::MemoryType const &itemSize, detail::MemoryType &used, std::condition_variable &nonempty)**
Inserts element into the [ConcurrentQueue](#).
- **static ReturnType doEnq (T const &item, SequenceType &elements, SizeType &size, SizeType &capacity, detail::MemoryType &used, detail::MemoryType &memory, size_t &elementsDropped, std::condition_variable &nonempty)**
Attempts to enqueue an item.

6.10.1 Detailed Description

```
template<class T>struct artdaq::KeepNewest< T >
```

[ConcurrentQueue](#) policy to discard oldest elements when the queue is full.

Template Parameters

<i>T</i>	Type of element to store in queue
----------	-----------------------------------

Definition at line 255 of file ConcurrentQueue.hh.

6.10.2 Member Function Documentation

6.10.2.1 template<class T > static ReturnType artdaq::KeepNewest< T >::doEnq (*T const & item, SequenceType & elements, SizeType & size, SizeType & capacity, detail::MemoryType & used, detail::MemoryType & memory, size_t & elementsDropped, std::condition_variable & nonempty*) [inline], [static]

Attempts to enqueue an item.

Parameters

<i>item</i>	Item to enqueue
<i>elements</i>	The ConcurrentQueue data
<i>size</i>	Number of elements in the ConcurrentQueue
<i>capacity</i>	Maximum number of elements in the ConcurrentQueue
<i>used</i>	Memory used by the ConcurrentQueue elements
<i>memory</i>	Amount of memory available for use by the ConcurrentQueue
<i>elements-Dropped</i>	Number of failed insert operations
<i>nonempty</i>	Condition variable to notify readers of new data on the queue

Returns

Number of elements removed from the queue

Definition at line 300 of file ConcurrentQueue.hh.

6.10.2.2 template<class T > static void artdaq::KeepNewest< T >::doInsert (*T const & item, SequenceType & elements, SizeType & size, detail::MemoryType const & itemSize, detail::MemoryType & used, std::condition_variable & nonempty*) [inline], [static]

Inserts element into the [ConcurrentQueue](#).

Parameters

<i>item</i>	Item to insert
<i>elements</i>	The ConcurrentQueue data
<i>size</i>	Number of elements in the ConcurrentQueue
<i>itemSize</i>	Size of the newly-inserted element
<i>used</i>	Memory used by the ConcurrentQueue elements
<i>nonempty</i>	Condition variable to notify readers of new data on queue

Definition at line 272 of file ConcurrentQueue.hh.

The documentation for this struct was generated from the following file:

- artdaq-core/artdaq-core/Core/ConcurrentQueue.hh

6.11 artdaq::ContainerFragment::Metadata Struct Reference

Contains the information necessary for retrieving [Fragment](#) objects from the [ContainerFragment](#).

```
#include <artdaq-core/Data/ContainerFragment.hh>
```

Public Types

- `typedef uint8_t data_t`
Basic unit of data-retrieval.
- `typedef uint64_t count_t`
Size of block_count variables.

Public Attributes

- `count_t block_count: 55`
The number of [Fragment](#) objects stored in the [ContainerFragment](#).
- `count_t fragment_type: 8`
The [Fragment::type_t](#) of stored [Fragment](#) objects.
- `count_t missing_data: 1`
Flag if the [ContainerFragment](#) knows that it is missing data.
- `size_t index [CONTAINER_FRAGMENT_COUNT_MAX]`
Offset of each [Fragment](#) within the [ContainerFragment](#).

Static Public Attributes

- `static size_t const size_words = 8ul + CONTAINER_FRAGMENT_COUNT_MAX * sizeof(size_t) / sizeof(data_t)`
Size of the [Metadata](#) object.

6.11.1 Detailed Description

Contains the information necessary for retrieving [Fragment](#) objects from the [ContainerFragment](#).

Definition at line 37 of file ContainerFragment.hh.

The documentation for this struct was generated from the following file:

- artdaq-core/artdaq-core/Data/ContainerFragment.hh

6.12 MetadataTypeHuge Struct Reference

Test Metadata that is very large.

Public Attributes

- `uint64_t fields [300]`
300 long words

6.12.1 Detailed Description

Test Metadata that is very large.

Definition at line 34 of file Fragment_t.cc.

The documentation for this struct was generated from the following file:

- artdaq-core/test/Data/Fragment_t.cc

6.13 MetadataTypeOne Struct Reference

Test Metadata with three fields in two long words.

Public Attributes

- uint64_t [field1](#)
- uint32_t [field2](#)
- uint32_t [field3](#)

6.13.1 Detailed Description

Test Metadata with three fields in two long words.

Definition at line 11 of file Fragment_t.cc.

6.13.2 Member Data Documentation

6.13.2.1 uint64_t MetadataTypeOne::field1

1. A 64-bit field

Definition at line 13 of file Fragment_t.cc.

6.13.2.2 uint32_t MetadataTypeOne::field2

1. A 32-bit field

Definition at line 14 of file Fragment_t.cc.

6.13.2.3 uint32_t MetadataTypeOne::field3

1. A 32-bit field

Definition at line 15 of file Fragment_t.cc.

The documentation for this struct was generated from the following file:

- artdaq-core/test/Data/Fragment_t.cc

6.14 MetadataTypeTwo Struct Reference

Test Metadata with five fields, mixing field sizes.

Public Attributes

- `uint64_t field1`
- `uint32_t field2`
- `uint32_t field3`
- `uint64_t field4`
- `uint16_t field5`

6.14.1 Detailed Description

Test Metadata with five fields, mixing field sizes.

Definition at line 22 of file `Fragment_t.cc`.

6.14.2 Member Data Documentation

6.14.2.1 `uint64_t MetadataTypeTwo::field1`

1. A 64-bit field

Definition at line 24 of file `Fragment_t.cc`.

6.14.2.2 `uint32_t MetadataTypeTwo::field2`

1. A 32-bit field

Definition at line 25 of file `Fragment_t.cc`.

6.14.2.3 `uint32_t MetadataTypeTwo::field3`

1. A 32-bit field

Definition at line 26 of file `Fragment_t.cc`.

6.14.2.4 `uint64_t MetadataTypeTwo::field4`

1. A 64-bit field

Definition at line 27 of file `Fragment_t.cc`.

6.14.2.5 uint16_t MetadataTypeTwo::field5

1. A 16-bit field

Definition at line 28 of file Fragment_t.cc.

The documentation for this struct was generated from the following file:

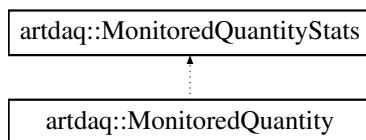

- artdaq-core/test/Data/Fragment_t.cc

6.15 artdaq::MonitoredQuantity Class Reference

This class keeps track of statistics for a set of sample values and provides timing information on the samples.

```
#include <artdaq-core/Core/MonitoredQuantity.hh>
```

Inheritance diagram for artdaq::MonitoredQuantity:

Public Member Functions

- **MonitoredQuantity** (`DURATION_T` expectedCalculationInterval, `DURATION_T` timeWindowForRecentResults)

Instantiates a `MonitoredQuantity` object.
- void **addSample** (const double value=1.0)

Adds the specified doubled valued sample value to the monitor instance.
- void **addSample** (const int value=1)

Adds the specified integer valued sample value to the monitor instance.
- void **addSample** (const `uint32_t` value=1)

Adds the specified `uint32_t` valued sample value to the monitor instance.
- void **addSample** (const `uint64_t` value=1)

Adds the specified `uint64_t` valued sample value to the monitor instance.
- bool **calculateStatistics** (`TIME_POINT_T` currentTime=`getCurrentTime()`)

Forces a calculation of the statistics for the monitored quantity.
- void **reset** ()
- void **enable** ()
- void **disable** ()
- bool **isEnabled** () const

Tests whether the monitor is currently enabled.
- void **setNewTimeWindowForRecentResults** (`DURATION_T` interval)

Specifies a new time interval to be used when calculating "recent" statistics.
- `DURATION_T` **getTimeWindowForRecentResults** () const

Returns the length of the time window that has been specified for recent results.
- `DURATION_T` **ExpectedCalculationInterval** () const

Returns the expected interval between calculateStatistics calls.

- bool `waitForAccumulatorsHaveBeenFlushed (DURATION_T timeout) const`
Blocks while the `MonitoredQuantity` is flushed, up to timeout duration.
- void `getStats (MonitoredQuantityStats &stats) const`
Write all our collected statistics into the given Stats struct.
- TIME_POINT_T `getLastCalculationTime () const`
Access the last calculation time.
- DURATION_T `getFullDuration () const`
Access the full duration of the statistics.
- double `getRecentValueSum () const`
Access the sum of the value samples in the "recent" time span.
- double `getRecentValueAverage () const`
Access the average of the value samples in the "recent" time span.
- long long `getFullSampleCount () const`
Access the count of samples for the entire history of the `MonitoredQuantity`.

Static Public Member Functions

- static TIME_POINT_T `getCurrentTime ()`
Returns the current point in time.

6.15.1 Detailed Description

This class keeps track of statistics for a set of sample values and provides timing information on the samples.

Definition at line 158 of file MonitoredQuantity.hh.

6.15.2 Constructor & Destructor Documentation

6.15.2.1 MonitoredQuantity::MonitoredQuantity (DURATION_T *expectedCalculationInterval*, DURATION_T *timeWindowForRecentResults*) [explicit]

Instantiates a `MonitoredQuantity` object.

Parameters

<code>expectedCalculationInterval</code>	How often calculateStatistics is expected to be called
<code>timeWindowForRecentResults</code>	Defines the meaning of <code>DataSetType::RECENT</code>

Definition at line 9 of file MonitoredQuantity.cc.

6.15.3 Member Function Documentation

6.15.3.1 void MonitoredQuantity::addSample (const double *value* = 1.0)

Adds the specified doubled valued sample value to the monitor instance.

Parameters

<i>value</i>	The sample value to add
--------------	-------------------------

Definition at line 19 of file MonitoredQuantity.cc.

6.15.3.2 void MonitoredQuantity::addSample (const int *value* = 1)

Adds the specified integer valued sample value to the monitor instance.

Parameters

<i>value</i>	The sample value to add
--------------	-------------------------

Definition at line 35 of file MonitoredQuantity.cc.

6.15.3.3 void MonitoredQuantity::addSample (const uint32_t *value* = 1)

Adds the specified uint32_t valued sample value to the monitor instance.

Parameters

<i>value</i>	The sample value to add
--------------	-------------------------

Definition at line 40 of file MonitoredQuantity.cc.

6.15.3.4 void MonitoredQuantity::addSample (const uint64_t *value* = 1)

Adds the specified uint64_t valued sample value to the monitor instance.

Parameters

<i>value</i>	The sample value to add
--------------	-------------------------

Definition at line 45 of file MonitoredQuantity.cc.

6.15.3.5 bool MonitoredQuantity::calculateStatistics (TIME_POINT_T *currentTime* = getCurrentTime())

Forces a calculation of the statistics for the monitored quantity.

Parameters

<i>currentTime</i>	Time point to use for calculating statistics (if synchronized at a higher level)
--------------------	--

Returns

Whether the statistics were calculated

Forces a calculation of the statistics for the monitored quantity. The frequency of the updates to the statistics is driven by how often this method is called. It is expected that this method will be called once per interval specified by `expectedCalculationInterval`

Definition at line 50 of file MonitoredQuantity.cc.

6.15.3.6 void MonitoredQuantity::disable()

Disables the monitor.

Definition at line 274 of file MonitoredQuantity.cc.

6.15.3.7 void MonitoredQuantity::enable()

Enables the monitor (and resets the statistics to provide a fresh start).

Definition at line 265 of file MonitoredQuantity.cc.

6.15.3.8 DURATION_T artdaq::MonitoredQuantity::ExpectedCalculationInterval() const [inline]

Returns the expected interval between calculateStatistics calls.

Returns

The expected interval between calculateStatistics calls

Definition at line 259 of file MonitoredQuantity.hh.

6.15.3.9 MonitoredQuantity::TIME_POINT_T MonitoredQuantity::getCurrentTime() [static]

Returns the current point in time.

Returns

The current point in time.

Returns the current point in time. A negative value indicates that an error occurred when fetching the time from the operating system.

Definition at line 381 of file MonitoredQuantity.cc.

6.15.3.10 void MonitoredQuantity::getStats(MonitoredQuantityStats & stats) const

Write all our collected statistics into the given Stats struct.

Parameters

<i>stats</i>	Destination for copy of collected statistics
--------------	--

Definition at line 338 of file MonitoredQuantity.cc.

6.15.3.11 DURATION_T artdaq::MonitoredQuantity::getTimeWindowForRecentResults() const [inline]

Returns the length of the time window that has been specified for recent results.

Returns

The length of the time windows for recent results

Returns the length of the time window that has been specified for recent results. (This may be different than the actual length of the recent time window which is affected by the interval of calls to the [calculateStatistics\(\)](#) method. Use a `getDuration(RECENT)` call to determine the actual recent time window.)

Definition at line 250 of file MonitoredQuantity.hh.

6.15.3.12 bool artdaq::MonitoredQuantity::isEnabled () const [inline]

Tests whether the monitor is currently enabled.

Returns

Whether the monitor is currently enabled.

Definition at line 230 of file MonitoredQuantity.hh.

6.15.3.13 void MonitoredQuantity::reset ()

Resets the monitor (zeroes out all counters and restarts the time interval).

Definition at line 253 of file MonitoredQuantity.cc.

6.15.3.14 void MonitoredQuantity::setNewTimeWindowForRecentResults (DURATION_T *interval*)

Specifies a new time interval to be used when calculating "recent" statistics.

Parameters

<i>interval</i>	The new time interval for calculating "recent" statistics.
-----------------	--

Definition at line 281 of file MonitoredQuantity.cc.

6.15.3.15 bool MonitoredQuantity::waitForAccumulatorsHaveBeenFlushed (DURATION_T *timeout*) const

Blocks while the [MonitoredQuantity](#) is flushed, up to timeout duration.

Parameters

<i>timeout</i>	How long to wait for the MonitoredQuantity to be emptied, in seconds
----------------	--

Returns

Whether the [MonitoredQuantity](#) was emptied within the specified timeout

Definition at line 318 of file MonitoredQuantity.cc.

The documentation for this class was generated from the following files:

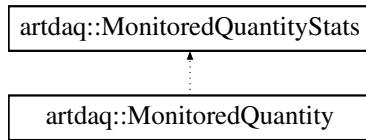

- artdaq-core/artdaq-core/Core/MonitoredQuantity.hh
- artdaq-core/artdaq-core/Core/MonitoredQuantity.cc

6.16 artdaq::MonitoredQuantityStats Struct Reference

struct containing [MonitoredQuantity](#) data

```
#include <artdaq-core/Core/MonitoredQuantity.hh>
```

Inheritance diagram for artdaq::MonitoredQuantityStats:

Public Types

- enum [DataSetType](#) { [DataSetType::FULL](#) = 0, [DataSetType::RECENT](#) = 1 }
Which data points to return (all or only recent)
- typedef double [DURATION_T](#)
A Duration.
- typedef double [TIME_POINT_T](#)
A point in time.

Public Member Functions

- long long [getSampleCount](#) ([DataSetType](#) t=[DataSetType::FULL](#)) const
Returns the sample count for the requested interval.
- double [getValueSum](#) ([DataSetType](#) t=[DataSetType::FULL](#)) const
Returns the sum of values in the requested interval.
- double [getValueAverage](#) ([DataSetType](#) t=[DataSetType::FULL](#)) const
Returns the average of the values in the requested interval.
- double [getValueRate](#) ([DataSetType](#) t=[DataSetType::FULL](#)) const
Returns the sum of the values in the requested interval, divided by the duration of the requested interval.
- double [getValueRMS](#) ([DataSetType](#) t=[DataSetType::FULL](#)) const
Returns the RMS of the values in the requested interval.
- double [getValueMin](#) ([DataSetType](#) t=[DataSetType::FULL](#)) const
Returns the smallest of the values in the requested interval.
- double [getValueMax](#) ([DataSetType](#) t=[DataSetType::FULL](#)) const
Returns the largest of the values in the requested interval.
- [DURATION_T](#) [getDuration](#) ([DataSetType](#) t=[DataSetType::FULL](#)) const
Returns the duration of the requested interval.
- double [getSampleRate](#) ([DataSetType](#) t=[DataSetType::FULL](#)) const
Returns the sample rate in the requested interval.
- double [getSampleLatency](#) ([DataSetType](#) t=[DataSetType::FULL](#)) const
- double [getLastSampleValue](#) () const
Accessor for the last sample value recorded.
- double [getLastValueRate](#) () const
Accessor for the lastValueRate (Sum of last samples over interval between calculateStatistics calls)
- bool [isEnabled](#) () const
Access the enable flag.

Public Attributes

- long long **fullSampleCount**
The total number of samples represented.
- double **fullSampleRate**
The total number of samples over the full duration of sampling.
- double **fullValueSum**
The sum of all samples.
- double **fullValueSumOfSquares**
The sum of the squares of all samples.
- double **fullValueAverage**
The average of all samples.
- double **fullValueRMS**
The RMS of all samples.
- double **fullValueMin**
The smallest value of all samples.
- double **fullValueMax**
The largest value of all samples.
- double **fullValueRate**
The sum of all samples over the full duration of sampling.
- DURATION_T **fullDuration**
The full duration of sampling.
- long long **recentSampleCount**
The number of samples in the "recent" time window.
- double **recentSampleRate**
The number of samples in the "recent" time window, divided by the length of that window.
- double **recentValueSum**
The sum of the "recent" samples.
- double **recentValueSumOfSquares**
The sum of the squares of the "recent" samples.
- double **recentValueAverage**
The average of the "recent" samples.
- double **recentValueRMS**
The RMS of the "recent" samples.
- double **recentValueMin**
The smallest value of the "recent" samples.
- double **recentValueMax**
The largest value of the "recent" samples.
- double **recentValueRate**
The sum of the "recent" samples, divided by the length of the "recent" time window.
- DURATION_T **recentDuration**
The length of the "recent" time window.
- std::vector< long long > **recentBinnedSampleCounts**
Sample counts for each instance of calculateStatistics in _intervalForRecentStats (rolling window)
- std::vector< double > **recentBinnedValueSums**
Sums for each instance of calculateStatistics in _intervalForRecentStats (rolling window)
- std::vector< DURATION_T > **recentBinnedDurations**

Duration between each instance of calculateStatistics in _intervalForRecentStats (rolling window)

- std::vector< TIME_POINT_T > recentBinnedEndTimes

Last sample time in each instance of calculateStatistics in _intervalForRecentStats (rolling window)

- double lastSampleValue

Value of the most recent sample.

- double lastValueRate

Latest rate point (sum of values over calculateStatistics interval)

- TIME_POINT_T lastCalculationTime

Last time calculateStatistics was called.

- bool enabled

Whether the MonitoredQuantity is collecting data.

6.16.1 Detailed Description

struct containing [MonitoredQuantity](#) data

Definition at line 15 of file [MonitoredQuantity.hh](#).

6.16.2 Member Enumeration Documentation

6.16.2.1 enum artdaq::MonitoredQuantityStats::DataSetType [strong]

Which data points to return (all or only recent)

Enumerator

FULL the full data set (all samples)

RECENT recent data only

Definition at line 23 of file [MonitoredQuantity.hh](#).

6.16.3 Member Function Documentation

6.16.3.1 DURATION_T artdaq::MonitoredQuantityStats::getDuration (DataSetType t = DataSetType::FULL) const [inline]

Returns the duration of the requested interval.

Parameters

t	Which interval to return, DataSetType::FULL (default) or DataSetType::RECENT
---	--

Returns

The duration of the requested interval

Definition at line 115 of file [MonitoredQuantity.hh](#).

6.16.3.2 double artdaq::MonitoredQuantityStats::getLastSampleValue () const [inline]

Accessor for the last sample value recorded.

Returns

The last sample value recorded

Definition at line 139 of file MonitoredQuantity.hh.

6.16.3.3 double artdaq::MonitoredQuantityStats::getLastValueRate () const [inline]

Accessor for the lastValueRate (Sum of last samples over interval between calculateStatistics calls)

Returns

The lastValueRate (Sum of last samples over interval between calculateStatistics calls)

Definition at line 145 of file MonitoredQuantity.hh.

6.16.3.4 long long artdaq::MonitoredQuantityStats::getSampleCount (DataSetType t = DataSetType::FULL) const [inline]

Returns the sample count for the requested interval.

Parameters

<i>t</i>	Which interval to return, DataSetType::FULL (default) or DataSetType::RECENT
----------	--

Returns

The sample count for the requested interval

Definition at line 66 of file MonitoredQuantity.hh.

6.16.3.5 double artdaq::MonitoredQuantityStats::getSampleLatency (DataSetType t = DataSetType::FULL) const [inline]**Parameters**

<i>t</i>	Which interval to return, DataSetType::FULL (default) or DataSetType::RECENT
----------	--

Returns

Definition at line 129 of file MonitoredQuantity.hh.

6.16.3.6 double artdaq::MonitoredQuantityStats::getSampleRate (DataSetType t = DataSetType::FULL) const [inline]

Returns the sample rate in the requested interval.

Parameters

<i>t</i>	Which interval to return, DataSetType::FULL (default) or DataSetType::RECENT
----------	--

Returns

The sample rate in the requested interval

Definition at line 122 of file MonitoredQuantity.hh.

6.16.3.7 double artdaq::MonitoredQuantityStats::getValueAverage (DataSetType *t* = DataSetType::FULL) const [inline]

Returns the average of the values in the requested interval.

Parameters

<i>t</i>	Which interval to return, DataSetType::FULL (default) or DataSetType::RECENT
----------	--

Returns

The average of the values in the requested interval

Definition at line 80 of file MonitoredQuantity.hh.

6.16.3.8 double artdaq::MonitoredQuantityStats::getValueMax (DataSetType *t* = DataSetType::FULL) const [inline]

Returns the largest of the values in the requested interval.

Parameters

<i>t</i>	Which interval to return, DataSetType::FULL (default) or DataSetType::RECENT
----------	--

Returns

The largest of the values in the requested interval

Definition at line 108 of file MonitoredQuantity.hh.

6.16.3.9 double artdaq::MonitoredQuantityStats::getValueMin (DataSetType *t* = DataSetType::FULL) const [inline]

Returns the smallest of the values in the requested interval.

Parameters

<i>t</i>	Which interval to return, DataSetType::FULL (default) or DataSetType::RECENT
----------	--

Returns

The smallest of the values in the requested interval

Definition at line 101 of file MonitoredQuantity.hh.

6.16.3.10 double artdaq::MonitoredQuantityStats::getValueRate (DataSetType *t* = DataSetType::FULL) const [inline]

Returns the sum of the values in the requested interval, divided by the duration of the requested interval.

Parameters

<i>t</i>	Which interval to return, DataSetType::FULL (default) or DataSetType::RECENT
----------	--

Returns

The sum of the values in the requested interval, divided by the duration of the requested interval

Definition at line 87 of file MonitoredQuantity.hh.

6.16.3.11 double artdaq::MonitoredQuantityStats::getValueRMS (DataSetType *t* = DataSetType::FULL) const [inline]

Returns the RMS of the values in the requested interval.

Parameters

<i>t</i>	Which interval to return, DataSetType::FULL (default) or DataSetType::RECENT
----------	--

Returns

The RMS of the values in the requested interval

Definition at line 94 of file MonitoredQuantity.hh.

6.16.3.12 double artdaq::MonitoredQuantityStats::getValueSum (DataSetType *t* = DataSetType::FULL) const [inline]

Returns the sum of values in the requested interval.

Parameters

<i>t</i>	Which interval to return, DataSetType::FULL (default) or DataSetType::RECENT
----------	--

Returns

The sum of values in the requested interval

Definition at line 73 of file MonitoredQuantity.hh.

6.16.3.13 bool artdaq::MonitoredQuantityStats::isEnabled () const [inline]

Access the enable flag.

Returns

The current value of the enable flag

Definition at line 151 of file MonitoredQuantity.hh.

The documentation for this struct was generated from the following file:

- artdaq-core/artdaq-core/Core/MonitoredQuantity.hh

6.17 artdaq::PackageBuildInfo Class Reference

Class holding information about the *artdaq* package build.

```
#include <artdaq-core/Data/PackageBuildInfo.hh>
```

Public Member Functions

- [PackageBuildInfo \(\)](#)
Default Constructor.
- [std::string getPackageName \(\) const](#)
Gets the package name.
- [std::string getPackageVersion \(\) const](#)
Gets the package version.
- [std::string getBuildTimestamp \(\) const](#)
Gets the build timestamp.
- [void setPackageName \(std::string str\)](#)
Sets the package name.
- [void setPackageVersion \(std::string str\)](#)
Sets the package version.
- [void setBuildTimestamp \(std::string str\)](#)
Sets the build timestamp.

6.17.1 Detailed Description

Class holding information about the *artdaq* package build.

The [PackageBuildInfo](#) class contains the name of the package, the version, and the timestamp of the build. *artdaq* stores this information in each data file.

Definition at line 18 of file PackageBuildInfo.hh.

6.17.2 Member Function Documentation

6.17.2.1 std::string artdaq::PackageBuildInfo::getBuildTimestamp () const [inline]

Gets the build timestamp.

Returns

The timestamp of the build

Definition at line 42 of file PackageBuildInfo.hh.

6.17.2.2 std::string artdaq::PackageBuildInfo::getPackageName () const [inline]

Gets the package name.

Returns

The package name

Definition at line 30 of file PackageBuildInfo.hh.

6.17.2.3 std::string artdaq::PackageBuildInfo::getPackageVersion() const [inline]

Gets the package version.

Returns

The package version

Definition at line 36 of file PackageBuildInfo.hh.

6.17.2.4 void artdaq::PackageBuildInfo::setBuildTimestamp(std::string str) [inline]

Sets the build timestamp.

Parameters

str	The timestamp of the build
-----	----------------------------

Definition at line 60 of file PackageBuildInfo.hh.

6.17.2.5 void artdaq::PackageBuildInfo::setPackageName(std::string str) [inline]

Sets the package name.

Parameters

str	The package name
-----	------------------

Definition at line 48 of file PackageBuildInfo.hh.

6.17.2.6 void artdaq::PackageBuildInfo::setPackageVersion(std::string str) [inline]

Sets the package version.

Parameters

str	The package version
-----	---------------------

Definition at line 54 of file PackageBuildInfo.hh.

The documentation for this class was generated from the following file:

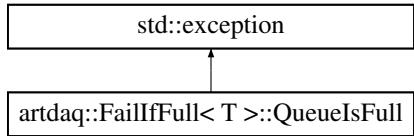

- artdaq-core/artdaq-core/Data/PackageBuildInfo.hh

6.18 artdaq::FailIfFull< T >::QueuelSFull Struct Reference

Exception thrown by [FailIfFull](#) policy when an enqueue operation is attempted on a full queue.

```
#include <artdaq-core/Core/ConcurrentQueue.hh>
```

Inheritance diagram for artdaq::FailIfFull< T >::QueuelSFull:

Public Member Functions

- virtual const char * **what** () const throw ()

Describe exception.

6.18.1 Detailed Description

`template<class T>struct artdaq::FailIfFull< T >::QueueIsFull`

Exception thrown by `FailIfFull` policy when an enqueue operation is attempted on a full queue.

Definition at line 171 of file ConcurrentQueue.hh.

6.18.2 Member Function Documentation

- 6.18.2.1 `template<class T > virtual const char* artdaq::FailIfFull< T >::QueueIsFull::what() const throw() [inline], [virtual]`

Describe exception.

Returns

Description of `QueueIsFull` exception

Definition at line 177 of file ConcurrentQueue.hh.

The documentation for this struct was generated from the following file:

- artdaq-core/artdaq-core/Core/ConcurrentQueue.hh

6.19 artdaq::QuickVec< TT_ > Struct Template Reference

A `QuickVec` behaves like a `std::vector`, but does no initialization of its data, making it faster at the cost of having to ensure that uninitialized data is not read.

`#include <artdaq-core/Core/QuickVec.hh>`

Public Types

- `typedef TT_ * iterator`

Iterator is pointer-to-member type.
- `typedef const TT_ * const_iterator`

const_iterator is const-pointer-to-member type

- `typedef TT_ & reference`
`reference is reference-to-member type`
- `typedef const TT_ & const_reference`
`const_reference is const-reference-to-member type`
- `typedef TT_ value_type`
`value_type is member type`
- `typedef ptrdiff_t difference_type`
`difference_type is ptrdiff_t`
- `typedef size_t size_type`
`size_type is size_t`

Public Member Functions

- `QuickVec (size_t sz)`
Allocates a `QuickVec` object, doing no initialization of allocated memory.
- `QuickVec (size_t sz, TT_ val)`
Allocates a `QuickVec` object, initializing each element to the given value.
- virtual `~QuickVec () noexcept`
Destructor calls free on data.
- `QuickVec (std::vector< TT_ > &other)`
Copies the contents of a `std::vector` into a new `QuickVec` object.
- `void clear ()`
Sets the size to 0. `QuickVec` does not reinitialize memory, so no further action will be taken.
- `QuickVec (const QuickVec &other)`
Copy Constructor.
- `QuickVec< TT_ > & operator= (const QuickVec &other)`
Copy assignment operator.
- `TT_ & operator[] (int idx)`
Returns a reference to a given element.
- `const TT_ & operator[] (int idx) const`
Returns a const reference to a given element.
- `size_t size () const`
Accesses the current size of the `QuickVec`.
- `size_t capacity () const`
Accesses the current capacity of the `QuickVec`.
- `iterator begin ()`
Gets an iterator to the beginning of the `QuickVec`.
- `const_iterator begin () const`
Gets a const_iterator to the beginning of the `QuickVec`.
- `iterator end ()`
Gets an iterator to the end of the `QuickVec`.
- `const_iterator end () const`
Gets a const_iterator to the end of the `QuickVec`.
- `void reserve (size_t size)`
Allocates memory for the `QuickVec` so that its capacity is at least size.
- `void resize (size_t size)`
Resizes the `QuickVec`.

- void `resize` (size_t `size`, TT_ `val`)
Resizes the `QuickVec`, initializes new elements with `val`.
- iterator `insert` (const_iterator `position`, size_t `nn`, const TT_ &`val`)
Inserts an element into the `QuickVec`.
- iterator `insert` (const_iterator `position`, const_iterator `first`, const_iterator `last`)
Inserts a range of elements into the `QuickVec`.
- iterator `erase` (const_iterator `first`, const_iterator `last`)
Erases elements in given range from the `QuickVec`.
- void `swap` (`QuickVec` &other) noexcept
Exchanges references to two `QuickVec` objects.
- void `push_back` (const value_type &`val`)
Adds a value to the `QuickVec`, resizing if necessary (adds 10% capacity)

Static Public Member Functions

- static short `Class_Version` ()
*Returns the current version of the template code | *.*

6.19.1 Detailed Description

`template<typename TT_> struct artdaq::QuickVec< TT_ >`

A `QuickVec` behaves like a `std::vector`, but does no initialization of its data, making it faster at the cost of having to ensure that uninitialized data is not read.

Template Parameters

<code>TT_</code>	The data type stored in the <code>QuickVec</code>
------------------	---

Definition at line 86 of file `QuickVec.hh`.

6.19.2 Constructor & Destructor Documentation

6.19.2.1 `template<typename TT_> artdaq::QuickVec< TT_ >::QuickVec(size_t sz) [inline]`

Allocates a `QuickVec` object, doing no initialization of allocated memory.

Parameters

<code>sz</code>	Size of <code>QuickVec</code> object to allocate
-----------------	--

Definition at line 338 of file `QuickVec.hh`.

6.19.2.2 `template<typename TT_> artdaq::QuickVec< TT_ >::QuickVec(size_t sz, TT_ val) [inline]`

Allocates a `QuickVec` object, initializing each element to the given value.

Parameters

<i>sz</i>	Size of QuickVec object to allocate
<i>val</i>	Value with which to initialize elements

Definition at line 347 of file QuickVec.hh.

6.19.2.3 template<typename TT_> artdaq::QuickVec< TT_ >::QuickVec(std::vector< TT_ > & *other*) [inline]

Copies the contents of a std::vector into a new [QuickVec](#) object.

Parameters

<i>other</i>	The vector to copy
--------------	--------------------

Definition at line 118 of file QuickVec.hh.

6.19.2.4 template<typename TT_> artdaq::QuickVec< TT_ >::QuickVec(const QuickVec< TT_ > & *other*) [inline]

Copy Constructor.

Parameters

<i>other</i>	QuickVec to copy
--------------	----------------------------------

Definition at line 138 of file QuickVec.hh.

6.19.3 Member Function Documentation

6.19.3.1 template<typename TT_> QuickVec< TT_ >::iterator artdaq::QuickVec< TT_ >::begin() [inline]

Gets an iterator to the beginning of the [QuickVec](#).

Returns

An iterator to the beginning of the [QuickVec](#)

Definition at line 387 of file QuickVec.hh.

6.19.3.2 template<typename TT_> QuickVec< TT_ >::const_iterator artdaq::QuickVec< TT_ >::begin() const [inline]

Gets a const_iterator to the beginning of the [QuickVec](#).

Returns

A const_iterator to the beginning of the [QuickVec](#)

Definition at line 390 of file QuickVec.hh.

6.19.3.3 template<typename TT_> size_t artdaq::QuickVec< TT_ >::capacity() const [inline]

Accesses the current capacity of the [QuickVec](#).

Returns

The current capacity of the [QuickVec](#)

Accesses the current capacity of the [QuickVec](#). Like a vector, the capacity of a [QuickVec](#) object is defined as the maximum size it can hold before it must reallocate more memory.

Definition at line 384 of file QuickVec.hh.

6.19.3.4 template<typename TT_> static short artdaq::QuickVec< TT_ >::Class_Version() [inline], [static]

Returns the current version of the template code *.

*

Returns

The current version of the [QuickVec](#) * * [Class_Version\(\)](#) MUST be updated every time private member data change. \

Definition at line 326 of file QuickVec.hh.

6.19.3.5 template<typename TT_> QuickVec< TT_ >::iterator artdaq::QuickVec< TT_ >::end() [inline]

Gets an iterator to the end of the [QuickVec](#).

Returns

An iterator to the end of the [QuickVec](#)

Definition at line 393 of file QuickVec.hh.

6.19.3.6 template<typename TT_> QuickVec< TT_ >::const_iterator artdaq::QuickVec< TT_ >::end() const [inline]

Gets a const_iterator to the end of the [QuickVec](#).

Returns

A const_iterator to the end of the [QuickVec](#)

Definition at line 396 of file QuickVec.hh.

6.19.3.7 template<typename TT_> QuickVec< TT_ >::iterator artdaq::QuickVec< TT_ >::erase(const_iterator first, const_iterator last) [inline]

Erases elements in given range from the [QuickVec](#).

Parameters

<i>first</i>	First element to erase
<i>last</i>	Last element to erase

Returns

iterator to first element after erase range

Erases elements in given range from the [QuickVec](#). Note that since the underlying data structure resembles a std::vector, erase operations are very inefficient! ($O(n)$)

Definition at line 484 of file QuickVec.hh.

6.19.3.8 template<typename TT_> QuickVec< TT_ >::iterator artdaq::QuickVec< TT_ >::insert(const_iterator position, size_t nn, const TT_ & val) [inline]

Inserts an element into the [QuickVec](#).

Parameters

<i>position</i>	Position at which to isnert
<i>nn</i>	Number of copies of val to insert
<i>val</i>	Value to insert

Returns

Iterator to first inserted element

Inserts an element (or copies thereof) into the [QuickVec](#). Note that since the underlying data structure resembles a std::vector, insert operations are very inefficient!

Definition at line 443 of file QuickVec.hh.

6.19.3.9 template<typename TT_> QuickVec< TT_ >::iterator artdaq::QuickVec< TT_ >::insert(const_iterator position, const_iterator first, const_iterator last) [inline]

Inserts a range of elements into the [QuickVec](#).

Parameters

<i>position</i>	Position at which to insert
<i>first</i>	const_iterator to first element to insert
<i>last</i>	const_iterator to last element to insert

Returns

Iterator to first inserted element

Inserts elements into the [QuickVec](#). Note that since the underlying data structure resembles a std::vector, insert operations are very inefficient!

Definition at line 463 of file QuickVec.hh.

6.19.3.10 template<typename TT_> QuickVec<TT_>& artdaq::QuickVec< TT_ >::operator= (const QuickVec< TT_ > & other) [inline]

Copy assignment operator.

Parameters

<i>other</i>	QuickVec to copy
--------------	------------------

Returns

Reference to new QuickVec object

Definition at line 153 of file QuickVec.hh.

6.19.3.11 template<typename TT_> TT_ & artdaq::QuickVec< TT_ >::operator[](int *idx*) [inline]

Returns a reference to a given element.

Parameters

<i>idx</i>	Element to return
------------	-------------------

Returns

Reference to element

Definition at line 367 of file QuickVec.hh.

6.19.3.12 template<typename TT_> const TT_ & artdaq::QuickVec< TT_ >::operator[](int *idx*) const [inline]

Returns a const reference to a given element.

Parameters

<i>idx</i>	Element to return
------------	-------------------

Returns

const reference to element

Definition at line 374 of file QuickVec.hh.

6.19.3.13 template<typename TT_> void artdaq::QuickVec< TT_ >::push_back(const value_type & *val*) [inline]

Adds a value to the QuickVec, resizing if necessary (adds 10% capacity)

Parameters

<i>val</i>	Value to add to the QuickVec
------------	------------------------------

Definition at line 513 of file QuickVec.hh.

6.19.3.14 template<typename TT_> void artdaq::QuickVec< TT_ >::reserve(size_t *size*) [inline]

Allocates memory for the QuickVec so that its capacity is at least size.

Parameters

<code>size</code>	The new capacity of the QuickVec
-------------------	--

Allocates memory for the [QuickVec](#) so that its capacity is at least size. If the [QuickVec](#) is already at or above size in capacity, no allocation is performed.

Definition at line 399 of file QuickVec.hh.

6.19.3.15 template<typename TT_> void artdaq::QuickVec< TT_ >::resize(size_t size) [inline]

Resizes the [QuickVec](#).

Parameters

<code>size</code>	New size of the QuickVec
-------------------	--

If size is smaller than the current size of the [QuickVec](#), then it will change its `size_` parameter (no reallocation, capacity does not change). If size is greater than the capacity of the [QuickVec](#), a reallocation will occur.

Definition at line 415 of file QuickVec.hh.

6.19.3.16 template<typename TT_> void artdaq::QuickVec< TT_ >::resize(size_t size, TT_ val) [inline]

Resizes the [QuickVec](#), initializes new elements with val.

Parameters

<code>size</code>	New size of the QuickVec
<code>val</code>	Value with which to initialize elements

Definition at line 432 of file QuickVec.hh.

6.19.3.17 template<typename TT_> size_t artdaq::QuickVec< TT_ >::size() const [inline]

Accesses the current size of the [QuickVec](#).

Returns

The current size of the [QuickVec](#)

Definition at line 381 of file QuickVec.hh.

6.19.3.18 template<typename TT_> void artdaq::QuickVec< TT_ >::swap(QuickVec< TT_ > & other) [inline], [noexcept]

Exchanges references to two [QuickVec](#) objects.

Parameters

<code>other</code>	Other QuickVec to swap with
--------------------	---

Definition at line 501 of file QuickVec.hh.

The documentation for this struct was generated from the following file:

- artdaq-core/artdaq-core/Core/QuickVec.hh

6.20 artdaq::RawEvent Class Reference

[RawEvent](#) is the artdaq view of a generic event, containing a header and zero or more Fragments.

```
#include <artdaq-core/Data/RawEvent.hh>
```

Public Types

- `typedef detail::RawEventHeader::run_id_t run_id_t`
Run numbers are 32 bits.
- `typedef detail::RawEventHeader::subrun_id_t subrun_id_t`
Subrun numbers are 32 bits.
- `typedef detail::RawEventHeader::sequence_id_t sequence_id_t`
Field size should be the same as the Fragment::sequence_id field.

Public Member Functions

- `RawEvent (run_id_t run, subrun_id_t subrun, sequence_id_t event)`
Constructs a RawEvent with the given parameters.
- `RawEvent (detail::RawEventHeader hdr)`
Constructs a RawEvent using the given RawEventHeader.
- `void insertFragment (FragmentPtr &&pfrag)`
Insert the given (pointer to a) Fragment into this RawEvent.
- `void markComplete ()`
Mark the event as complete.
- `size_t numFragments () const`
Return the number of fragments this RawEvent contains.
- `size_t wordCount () const`
Return the sum of the word counts of all fragments in this RawEvent.
- `run_id_t runID () const`
Retrieve the run number from the RawEventHeader.
- `subrun_id_t subrunID () const`
Retrieve the subrun number from the RawEventHeader.
- `sequence_id_t sequenceID () const`
Retrieve the sequence id from the RawEventHeader.
- `bool isComplete () const`
Retrieve the value of the complete flag from the RawEventHeader.
- `void print (std::ostream &os) const`
Print summary information about this RawEvent to the given stream.
- `std::unique_ptr< Fragments > releaseProduct ()`
Release all the Fragments from this RawEvent.
- `void fragmentTypes (std::vector< Fragment::type_t > &type_list)`
Fills in a list of unique fragment types from this event.
- `std::unique_ptr< Fragments > releaseProduct (Fragment::type_t type)`
Release Fragments from the RawEvent.

6.20.1 Detailed Description

[RawEvent](#) is the artdaq view of a generic event, containing a header and zero or more Fragments.

[RawEvent](#) should be a class, not a struct; it should be enforcing invariants (the contained Fragments should all have the correct event id).

Definition at line 64 of file RawEvent.hh.

6.20.2 Constructor & Destructor Documentation

6.20.2.1 `artdaq::RawEvent::RawEvent(run_id_t run, subrun_id_t subrun, sequence_id_t event) [inline]`

Constructs a [RawEvent](#) with the given parameters.

Parameters

<i>run</i>	The current Run number
<i>subrun</i>	The current Subrun number
<i>event</i>	The current sequence_id

Definition at line 184 of file RawEvent.hh.

6.20.2.2 `artdaq::RawEvent::RawEvent(detail::RawEventHeader hdr) [inline], [explicit]`

Constructs a [RawEvent](#) using the given RawEventHeader.

Parameters

<i>hdr</i>	Header to use for initializing RawEvent
------------	---

Definition at line 188 of file RawEvent.hh.

6.20.3 Member Function Documentation

6.20.3.1 `void artdaq::RawEvent::fragmentTypes(std::vector< Fragment::type_t > & type_list) [inline]`

Fills in a list of unique fragment types from this event.

Parameters

<i>type_list</i>	Any Fragment types not included in this list will be added
------------------	--

Definition at line 243 of file RawEvent.hh.

6.20.3.2 `void artdaq::RawEvent::insertFragment(FragmentPtr && pfrag) [inline]`

Insert the given (pointer to a) [Fragment](#) into this [RawEvent](#).

Parameters

<i>pfrag</i>	The FragmentPtr to insert into the RawEvent
--------------	---

Exceptions

<i>cet::exception</i>	if pfrag is nullptr
-----------------------	---------------------

Insert the given (pointer to a) [Fragment](#) into this [RawEvent](#). This takes ownership of the [Fragment](#) referenced by the FragmentPtr, unless an exception is thrown.

Definition at line 193 of file RawEvent.hh.

6.20.3.3 bool artdaq::RawEvent::isComplete() const [inline]

Retrieve the value of the complete flag from the RawEventHeader.

Returns

The value of RawEventHeader::is_complete

Definition at line 222 of file RawEvent.hh.

6.20.3.4 size_t artdaq::RawEvent::numFragments() const [inline]

Return the number of fragments this [RawEvent](#) contains.

Returns

The number of [Fragment](#) objects in this [RawEvent](#)

Definition at line 206 of file RawEvent.hh.

6.20.3.5 void artdaq::RawEvent::print(std::ostream & os) const

Print summary information about this [RawEvent](#) to the given stream.

Parameters

<i>os</i>	The target stream for summary information
-----------	---

Definition at line 6 of file RawEvent.cc.

6.20.3.6 std::unique_ptr< Fragments > artdaq::RawEvent::releaseProduct() [inline]

Release all the Fragments from this [RawEvent](#).

Returns

A pointer to a Fragments object (owns the [Fragment](#) data contained)

Release all the Fragments from this [RawEvent](#), returning them to the caller through a unique_ptr that manages a vector into which the Fragments have been moved.

Definition at line 225 of file RawEvent.hh.

6.20.3.7 std::unique_ptr< Fragments > artdaq::RawEvent::releaseProduct(Fragment::type_t type) [inline]

Release Fragments from the [RawEvent](#).

Parameters

<code>type</code>	The type of Fragments to release
-------------------	----------------------------------

Returns

A pointer to a Fragments object (owns the [Fragment](#) data contained)

Release the Fragments from this [RawEvent](#) with the specified fragment type, returning them to the caller through a unique_ptr that manages a vector into which the Fragments have been moved. PLEASE NOTE that `releaseProduct` and `releaseProduct(type_t)` can not both be used on the same [RawEvent](#) since each one gives up ownership of the fragments within the event.

Definition at line 261 of file RawEvent.hh.

6.20.3.8 `RawEvent::run_id_t artdaq::RawEvent::runID() const [inline]`

Retrieve the run number from the RawEventHeader.

Returns

The run number stored in the RawEventHeader

Definition at line 219 of file RawEvent.hh.

6.20.3.9 `RawEvent::sequence_id_t artdaq::RawEvent::sequenceID() const [inline]`

Retrieve the sequence id from the RawEventHeader.

Returns

The sequence id stored in the RawEventHeader

Definition at line 221 of file RawEvent.hh.

6.20.3.10 `RawEvent::subrun_id_t artdaq::RawEvent::subrunID() const [inline]`

Retrieve the subrun number from the RawEventHeader.

Returns

The subrun number stored in the RawEventHeader

Definition at line 220 of file RawEvent.hh.

6.20.3.11 `size_t artdaq::RawEvent::wordCount() const [inline]`

Return the sum of the word counts of all fragments in this [RawEvent](#).

Returns

The sum of the word counts of all [Fragment](#) objects in this [RawEvent](#)

Definition at line 212 of file RawEvent.hh.

The documentation for this class was generated from the following files:

- artdaq-core/artdaq-core/Data/RawEvent.hh
- artdaq-core/artdaq-core/Data/RawEvent.cc

6.21 artdaq::detail::RawEventHeader Struct Reference

The header information used to identify key properties of the [RawEvent](#) object.

```
#include <artdaq-core/Data/RawEvent.hh>
```

Public Types

- `typedef uint32_t run_id_t`
Run numbers are 32 bits.
- `typedef uint32_t subrun_id_t`
Subrun numbers are 32 bits.
- `typedef Fragment::sequence_id_t sequence_id_t`
Field size should be the same as the Fragment::sequence_id field.

Public Member Functions

- `RawEventHeader (run_id_t run, subrun_id_t subrun, sequence_id_t event)`
Constructs the RawEventHeader struct with the given parameters.

Public Attributes

- `run_id_t run_id`
Fragments don't know about runs.
- `subrun_id_t subrun_id`
Fragments don't know about subruns.
- `sequence_id_t sequence_id`
RawEvent sequence_id should be the same as its component Fragment sequence_ids.
- `bool is_complete`
Does the event contain the expected number of Fragment objects?

6.21.1 Detailed Description

The header information used to identify key properties of the [RawEvent](#) object.

[RawEventHeader](#) is the artdaq generic event header. It contains the information necessary for routing of raw events inside the artdaq code, but is not intended for use by any experiment.

Definition at line 30 of file RawEvent.hh.

6.21.2 Constructor & Destructor Documentation

6.21.2.1 artdaq::detail::RawEventHeader::RawEventHeader (`run_id_t run, subrun_id_t subrun, sequence_id_t event`)
 [inline]

Constructs the `RawEventHeader` struct with the given parameters.

Parameters

<code>run</code>	The current Run number
<code>subrun</code>	The current Subrun number
<code>event</code>	The current sequence_id

Definition at line 47 of file RawEvent.hh.

The documentation for this struct was generated from the following file:

- artdaq-core/artdaq-core/Data/RawEvent.hh

6.22 artdaq::detail::RawFragmentHeader Struct Reference

The `RawFragmentHeader` class contains the basic fields used by *artdaq* for routing `Fragment` objects through the system.

```
#include <artdaq-core/Data/detail/RawFragmentHeader.hh>
```

Public Types

- `typedef unsigned long long RawDataType`
The RawDataType (currently a 64-bit integer) is the basic unit of data representation within artdaq
- `typedef uint16_t version_t`
version field is 16 bits
- `typedef uint64_t sequence_id_t`
sequence_id field is 48 bits
- `typedef uint8_t type_t`
type field is 8 bits
- `typedef uint16_t fragment_id_t`
fragment_id field is 16 bits
- `typedef uint8_t metadata_word_count_t`
metadata_word_count field is 8 bits
- `typedef uint64_t timestamp_t`
timestamp field is 32 bits

Public Member Functions

- `void setType (uint8_t utype)`
Sets the type field to the specified user type.
- `void setSystemType (uint8_t stype)`
Sets the type field to the specified system type.

Static Public Member Functions

- static std::map< `type_t`,
std::string > `MakeSystemTypeMap` ()

Returns a map of the most-commonly used system types.
- static std::map< `type_t`,
std::string > `MakeVerboseSystemTypeMap` ()

Returns a map of all system types.
- static std::string `SystemTypeToString` (`type_t type`)

Print a system type's string name.
- static constexpr std::size_t `num_words` ()

Returns the number of `RawDataType` words present in the header.

Public Attributes

- `RawDataType word_count`: 32

number of `RawDataType` words in this `Fragment`
- `RawDataType version`: 16

The version of the fragment. Currently always `InvalidVersion`.
- `RawDataType type`: 8

The type of the fragment, either system or user-defined.
- `RawDataType metadata_word_count`: 8

The number of `RawDataType` words in the user-defined metadata.
- `RawDataType sequence_id`: 48

The 48-bit `sequence_id` uniquely identifies events within the `artdaq` system.
- `RawDataType fragment_id`: 16

The `fragment_id` uniquely identifies a particular piece of hardware within the `artdaq` system.
- `RawDataType timestamp`: 64

The 64-bit timestamp field is the output of a user-defined clock used for building time-correlated events.

Static Public Attributes

- static constexpr `type_t INVALID_TYPE` = 0

Marks a `Fragment` as Invalid.
- static constexpr `type_t FIRST_USER_TYPE` = 1

The first user-accessible type.
- static constexpr `type_t LAST_USER_TYPE` = 224

The last user-accessible type (types above this number are system types).
- static constexpr `type_t FIRST_SYSTEM_TYPE` = 225

The first system type.
- static constexpr `type_t LAST_SYSTEM_TYPE` = 255

The last system type.
- static constexpr `type_t InvalidFragmentType` = `INVALID_TYPE`

Marks a `Fragment` as Invalid.
- static constexpr `type_t EndOfDataFragmentType` = `FIRST_SYSTEM_TYPE`

This `Fragment` indicates the end of data to art
- static constexpr `type_t DataFragmentType` = `FIRST_SYSTEM_TYPE` + 1

This Fragment holds data. Used for `RawEvent` Fragments sent from the `EventBuilder` to the Aggregator.

- static constexpr `type_t` `InitFragmentType` = `FIRST_SYSTEM_TYPE` + 2
This Fragment holds the necessary data for initializing art
- static constexpr `type_t` `EndOfRunFragmentType` = `FIRST_SYSTEM_TYPE` + 3
This Fragment indicates the end of a run to art
- static constexpr `type_t` `EndOfSubrunFragmentType` = `FIRST_SYSTEM_TYPE` + 4
This Fragment indicates the end of a subrun to art
- static constexpr `type_t` `ShutdownFragmentType` = `FIRST_SYSTEM_TYPE` + 5
This Fragment indicates a system shutdown to art

- static constexpr `type_t` `EmptyFragmentType` = `FIRST_SYSTEM_TYPE` + 6
This Fragment contains no data and serves as a placeholder for when no data from a `FragmentGenerator` is expected.
- static constexpr `type_t` `ContainerFragmentType` = `FIRST_SYSTEM_TYPE` + 7
This Fragment is a `ContainerFragment` and analysis code should unpack it.

- static const `version_t` `InvalidVersion` = 0xFFFF
The version field is currently 16-bits.
- static const `version_t` `CurrentVersion` = 0x1
The CurrentVersion field should be incremented whenever the `RawFragmentHeader` changes.
- static const `sequence_id_t` `InvalidSequenceID` = 0xFFFFFFFFFFFFFF
The sequence_id field is currently 48-bits.
- static const `fragment_id_t` `InvalidFragmentID` = 0xFFFF
The fragment_id field is currently 16-bits.
- static const `timestamp_t` `InvalidTimestamp` = 0xFFFFFFFFFFFFFF
The timestamp field is currently 32-bits.

6.22.1 Detailed Description

The `RawFragmentHeader` class contains the basic fields used by `artdaq` for routing `Fragment` objects through the system.

The `RawFragmentHeader` class contains the basic fields used by `artdaq` for routing `Fragment` objects through the system. It also contains static value definitions of values used in those fields.

Definition at line 33 of file `RawFragmentHeader.hh`.

6.22.2 Member Function Documentation

6.22.2.1 static std::map<type_t, std::string> `artdaq::detail::RawFragmentHeader::MakeSystemTypeMap()` [inline], [static]

Returns a map of the most-commonly used system types.

Returns

A map of the system types used in the `artdaq` data stream

Definition at line 68 of file `RawFragmentHeader.hh`.

6.22.2.2 static std::map<type_t, std::string> artdaq::detail::RawFragmentHeader::MakeVerboseSystemTypeMap () [inline], [static]

Returns a map of all system types.

Returns

A map of all defined system types

Definition at line 81 of file RawFragmentHeader.hh.

6.22.2.3 constexpr std::size_t artdaq::detail::RawFragmentHeader::num_words () [inline], [static]

Returns the number of RawDataType words present in the header.

Returns

The number of RawDataType words present in the header

Definition at line 175 of file RawFragmentHeader.hh.

6.22.2.4 void artdaq::detail::RawFragmentHeader::setSystemType (uint8_t stype) [inline]

Sets the type field to the specified system type.

Parameters

<i>stype</i>	The type code to set
--------------	----------------------

Exceptions

<i>cet::exception</i>	if stype is not in the allowed range for system types
-----------------------	---

Definition at line 205 of file RawFragmentHeader.hh.

6.22.2.5 void artdaq::detail::RawFragmentHeader::setUserType (uint8_t utype) [inline]

Sets the type field to the specified user type.

Parameters

<i>utype</i>	The type code to set
--------------	----------------------

Exceptions

<i>cet::exception</i>	if utype is not in the allowed range for user types
-----------------------	---

Definition at line 191 of file RawFragmentHeader.hh.

6.22.2.6 static std::string artdaq::detail::RawFragmentHeader::SystemTypeToString (type_t type) [inline], [static]

Print a system type's string name.

Parameters

<code>type</code>	Type to print
-------------------	---------------

Returns

String with "Name" of type

Definition at line 100 of file RawFragmentHeader.hh.

The documentation for this struct was generated from the following file:

- artdaq-core/artdaq-core/Data/detail/RawFragmentHeader.hh

6.23 artdaq::detail::RawFragmentHeaderV0 Struct Reference

The [RawFragmentHeaderV0](#) class contains the basic fields used by *artdaq* for routing [Fragment](#) objects through the system.

```
#include <artdaq-core/Data/detail/RawFragmentHeaderV0.hh>
```

Public Types

- `typedef unsigned long long RawDataType`

The RawDataType (currently a 64-bit integer) is the basic unit of data representation within artdaq

- `typedef uint16_t version_t`

version field is 16 bits

- `typedef uint64_t sequence_id_t`

sequence_id field is 48 bits

- `typedef uint8_t type_t`

type field is 8 bits

- `typedef uint16_t fragment_id_t`

fragment_id field is 16 bits

- `typedef uint8_t metadata_word_count_t`

metadata_word_count field is 8 bits

- `typedef uint32_t timestamp_t`

timestamp field is 32 bits

Public Member Functions

- `void setType (uint8_t utype)`

Sets the type field to the specified user type.

- `void setSystemType (uint8_t stype)`

Sets the type field to the specified system type.

- `RawFragmentHeader upgrade () const`

Upgrades the RawFragmentHeaderV0 to a RawFragmentHeader (Current version)

Static Public Member Functions

- static std::map< `type_t`,
std::string > `MakeSystemTypeMap` ()
Returns a map of the most-commonly used system types.
- static std::map< `type_t`,
std::string > `MakeVerboseSystemTypeMap` ()
Returns a map of all system types.
- static constexpr std::size_t `num_words` ()
Returns the number of `RawDataType` words present in the header.

Public Attributes

- `RawDataType word_count`: 32
number of `RawDataType` words in this `Fragment`
- `RawDataType version`: 16
The version of the fragment. Currently always `InvalidVersion`.
- `RawDataType type`: 8
The type of the fragment, either system or user-defined.
- `RawDataType metadata_word_count`: 8
The number of `RawDataType` words in the user-defined metadata.
- `RawDataType sequence_id`: 48
The 48-bit `sequence_id` uniquely identifies events within the `artdaq` system.
- `RawDataType fragment_id`: 16
The `fragment_id` uniquely identifies a particular piece of hardware within the `artdaq` system.
- `RawDataType timestamp`: 32
The 64-bit `timestamp` field is the output of a user-defined clock used for building time-correlated events.
- `RawDataType unused1`: 16
Extra space.
- `RawDataType unused2`: 16
Extra space.

Static Public Attributes

- static constexpr `type_t INVALID_TYPE` = 0
Marks a `Fragment` as `Invalid`.
- static constexpr `type_t FIRST_USER_TYPE` = 1
The first user-accessible type.
- static constexpr `type_t LAST_USER_TYPE` = 224
The last user-accessible type (types above this number are system types).
- static constexpr `type_t FIRST_SYSTEM_TYPE` = 225
The first system type.
- static constexpr `type_t LAST_SYSTEM_TYPE` = 255
The last system type.
- static constexpr `type_t InvalidFragmentType` = `INVALID_TYPE`
Marks a `Fragment` as `Invalid`.
- static constexpr `type_t EndOfDataFragmentType` = `FIRST_SYSTEM_TYPE`

This Fragment indicates the end of data to art

- static constexpr `type_t` `DataFragmentType` = `FIRST_SYSTEM_TYPE` + 1

This Fragment holds data. Used for `RawEvent` Fragments sent from the `EventBuilder` to the Aggregator.

- static constexpr `type_t` `InitFragmentType` = `FIRST_SYSTEM_TYPE` + 2

This Fragment holds the necessary data for initializing art

- static constexpr `type_t` `EndOfRunFragmentType` = `FIRST_SYSTEM_TYPE` + 3

This Fragment indicates the end of a run to art

- static constexpr `type_t` `EndOfSubrunFragmentType` = `FIRST_SYSTEM_TYPE` + 4

This Fragment indicates the end of a subrun to art

- static constexpr `type_t` `ShutdownFragmentType` = `FIRST_SYSTEM_TYPE` + 5

This Fragment indicates a system shutdown to art

- static constexpr `type_t` `EmptyFragmentType` = `FIRST_SYSTEM_TYPE` + 6

This Fragment contains no data and serves as a placeholder for when no data from a `FragmentGenerator` is expected.

- static constexpr `type_t` `ContainerFragmentType` = `FIRST_SYSTEM_TYPE` + 7

This Fragment is a `ContainerFragment` and analysis code should unpack it.

- static const `version_t` `InvalidVersion` = 0xFFFF

The version field is currently 16-bits.

- static const `version_t` `CurrentVersion` = 0x0

The CurrentVersion field should be incremented whenever the `RawFragmentHeader` changes.

- static const `sequence_id_t` `InvalidSequenceID` = 0xFFFFFFFFFFFFFF

The sequence_id field is currently 48-bits.

- static const `fragment_id_t` `InvalidFragmentID` = 0xFFFF

The fragment_id field is currently 16-bits.

- static const `timestamp_t` `InvalidTimestamp` = 0xFFFFFFFF

The timestamp field is currently 32-bits.

6.23.1 Detailed Description

The `RawFragmentHeaderV0` class contains the basic fields used by `artdaq` for routing `Fragment` objects through the system.

The `RawFragmentHeaderV0` class contains the basic fields used by `artdaq` for routing `Fragment` objects through the system. It also contains static value definitions of values used in those fields. This is an old version of `RawFragmentHeader`, provided for compatibility

Definition at line 35 of file `RawFragmentHeaderV0.hh`.

6.23.2 Member Function Documentation

6.23.2.1 static std::map<`type_t`, std::string> artdaq::detail::RawFragmentHeaderV0::MakeSystemTypeMap() [inline], [static]

Returns a map of the most-commonly used system types.

Returns

A map of the system types used in the `artdaq` data stream

Definition at line 70 of file `RawFragmentHeaderV0.hh`.

6.23.2.2 static std::map<type_t, std::string> artdaq::detail::RawFragmentHeaderV0::MakeVerboseSystemTypeMap() [inline], [static]

Returns a map of all system types.

Returns

A map of all defined system types

Definition at line 83 of file RawFragmentHeaderV0.hh.

6.23.2.3 constexpr std::size_t artdaq::detail::RawFragmentHeaderV0::num_words() [inline], [static]

Returns the number of RawDataType words present in the header.

Returns

The number of RawDataType words present in the header

Definition at line 158 of file RawFragmentHeaderV0.hh.

6.23.2.4 void artdaq::detail::RawFragmentHeaderV0::setSystemType(uint8_t stype) [inline]

Sets the type field to the specified system type.

Parameters

<i>stype</i>	The type code to set
--------------	----------------------

Exceptions

<i>cet::exception</i>	if stype is not in the allowed range for system types
-----------------------	---

Definition at line 187 of file RawFragmentHeaderV0.hh.

6.23.2.5 void artdaq::detail::RawFragmentHeaderV0::setUserType(uint8_t utype) [inline]

Sets the type field to the specified user type.

Parameters

<i>utype</i>	The type code to set
--------------	----------------------

Exceptions

<i>cet::exception</i>	if utype is not in the allowed range for user types
-----------------------	---

Definition at line 173 of file RawFragmentHeaderV0.hh.

6.23.2.6 artdaq::detail::RawFragmentHeader artdaq::detail::RawFragmentHeaderV0::upgrade() const [inline]

Upgrades the [RawFragmentHeaderV0](#) to a [RawFragmentHeader](#) (Current version)

Returns

Current-version [RawFragmentHeader](#)

The constraints on [RawFragmentHeader](#) upgrades are that no field may shrink in size or be deleted. Therefore, there will always be an upgrade path from old RawFragmentHeaders to new ones. By convention, all fields are initialized to the Invalid defines, and then the old data (guaranteed to be smaller) is cast to the new header. In the case of added fields, they will remain marked Invalid.

Definition at line 200 of file [RawFragmentHeaderV0.hh](#).

The documentation for this struct was generated from the following file:

- [artdaq-core/artdaq-core/Data/detail/RawFragmentHeaderV0.hh](#)

6.24 artdaq::RejectNewest< T > Struct Template Reference

[ConcurrentQueue](#) policy to discard new elements when the queue is full.

```
#include <artdaq-core/Core/ConcurrentQueue.hh>
```

Public Types

- [typedef std::pair< T, size_t > ValueType](#)
Type of elements stored in the queue.
- [typedef std::list< T > SequenceType](#)
Type of sequences of items.
- [typedef SequenceType::size_type SizeType](#)
Size type of sequences.
- [typedef SizeType ReturnType](#)
Type returned by doEnq.

Static Public Member Functions

- [static void doInsert \(T const &item, SequenceType &elements, SizeType &size, detail::MemoryType const &itemSize, detail::MemoryType &used, std::condition_variable &nonempty\)](#)
Inserts element into the [ConcurrentQueue](#).
- [static ReturnType doEnq \(T const &item, SequenceType &elements, SizeType &size, SizeType &capacity, detail::MemoryType &used, detail::MemoryType &memory, size_t &elementsDropped, std::condition_variable &nonempty\)](#)
Attempts to enqueue an item.

6.24.1 Detailed Description

```
template<class T>struct artdaq::RejectNewest< T >
```

[ConcurrentQueue](#) policy to discard new elements when the queue is full.

Template Parameters

<i>T</i>	Type of element to store in queue
----------	-----------------------------------

Definition at line 343 of file ConcurrentQueue.hh.

6.24.2 Member Function Documentation

6.24.2.1 template<class T > static ReturnType artdaq::RejectNewest< T >::doEnq (*T const & item, SequenceType & elements, SizeType & size, SizeType & capacity, detail::MemoryType & used, detail::MemoryType & memory, size_t & elementsDropped, std::condition_variable & nonempty*) [inline], [static]

Attempts to enqueue an item.

Parameters

<i>item</i>	Item to enqueue
<i>elements</i>	The ConcurrentQueue data
<i>size</i>	Number of elements in the ConcurrentQueue
<i>capacity</i>	Maximum number of elements in the ConcurrentQueue
<i>used</i>	Memory used by the ConcurrentQueue elements
<i>memory</i>	Amount of memory available for use by the ConcurrentQueue
<i>elements-Dropped</i>	Number of failed insert operations
<i>nonempty</i>	Condition variable to notify readers of new data on the queue

Returns

Number of elements removed from the queue (1 if new element was rejected, 0 otherwise)

Definition at line 388 of file ConcurrentQueue.hh.

6.24.2.2 template<class T > static void artdaq::RejectNewest< T >::doInsert (*T const & item, SequenceType & elements, SizeType & size, detail::MemoryType const & itemSize, detail::MemoryType & used, std::condition_variable & nonempty*) [inline], [static]

Inserts element into the [ConcurrentQueue](#).

Parameters

<i>item</i>	Item to insert
<i>elements</i>	The ConcurrentQueue data
<i>size</i>	Number of elements in the ConcurrentQueue
<i>itemSize</i>	Size of the newly-inserted element
<i>used</i>	Memory used by the ConcurrentQueue elements
<i>nonempty</i>	Condition variable to notify readers of new data on queue

Definition at line 360 of file ConcurrentQueue.hh.

The documentation for this struct was generated from the following file:

- artdaq-core/artdaq-core/Core/ConcurrentQueue.hh

6.25 artdaq::SharedMemoryEventReceiver Class Reference

[SharedMemoryEventReceiver](#) can receive events (as written by SharedMemoryEventManager) from Shared Memory.

```
#include <artdaq-core/Core/SharedMemoryEventReceiver.hh>
```

Public Member Functions

- [SharedMemoryEventReceiver](#) (uint32_t *shm_key*, uint32_t *broadcast_shm_key*)
Connect to a Shared Memory segment using the given parameters.
- virtual ~[SharedMemoryEventReceiver](#) ()=default
SharedMemoryEventReceiver Destructor.
- bool [ReadyForRead](#) (bool *broadcast*=false, size_t *timeout_us*=1000000)
Determine whether an event is available for reading.
- [detail::RawEventHeader](#) * [ReadHeader](#) (bool &*err*)
Get the Event header.
- std::set< [Fragment](#)::type_t > [GetFragmentTypes](#) (bool &*err*)
Get a set of Fragment Types present in the event.
- std::unique_ptr< [Fragments](#) > [GetFragmentsByType](#) (bool &*err*, [Fragment](#)::type_t *type*)
Get a pointer to the Fragments of a given type in the event.
- std::string [toString](#) ()
Write out information about the Shared Memory to a string.
- void [ReleaseBuffer](#) ()
Release the buffer currently being read to the Empty state.
- int [GetRank](#) ()
Returns the Rank of the writing process.
- int [ReadReadyCount](#) ()
Get the count of available buffers, both broadcasts and data.
- size_t [size](#) ()
Get the size of the data buffer.

6.25.1 Detailed Description

[SharedMemoryEventReceiver](#) can receive events (as written by SharedMemoryEventManager) from Shared Memory.

Definition at line 15 of file SharedMemoryEventReceiver.hh.

6.25.2 Constructor & Destructor Documentation

6.25.2.1 artdaq::SharedMemoryEventReceiver::SharedMemoryEventReceiver (uint32_t *shm_key*, uint32_t *broadcast_shm_key*)

Connect to a Shared Memory segment using the given parameters.

Parameters

<i>shm_key</i>	Key of the Shared Memory segment
<i>broadcast_shm_key</i>	Key of the broadcast Shared Memory segment

Definition at line 11 of file SharedMemoryEventReceiver.cc.

6.25.3 Member Function Documentation

6.25.3.1 `std::unique_ptr< artdaq::Fragments > artdaq::SharedMemoryEventReceiver::GetFragmentsByType (bool & err, Fragment::type_t type)`

Get a pointer to the Fragments of a given type in the event.

Parameters

<i>err</i>	Flag used to indicate if an error has occurred
<i>type</i>	Type of Fragments to get. (Use InvalidFragmentType to get all Fragments)

Returns

`std::unique_ptr` to a `Fragments` object containing returned `Fragment` objects

Definition at line 119 of file SharedMemoryEventReceiver.cc.

6.25.3.2 `std::set< artdaq::Fragment::type_t > artdaq::SharedMemoryEventReceiver::GetFragmentTypes (bool & err)`

Get a set of `Fragment` Types present in the event.

Parameters

<i>err</i>	Flag used to indicate if an error has occurred
------------	--

Returns

`std::set` of `Fragment::type_t` of all `Fragment` types in the event

Definition at line 95 of file SharedMemoryEventReceiver.cc.

6.25.3.3 `int artdaq::SharedMemoryEventReceiver::GetRank () [inline]`

Returns the Rank of the writing process.

Returns

The rank of the writer process

Definition at line 74 of file SharedMemoryEventReceiver.hh.

6.25.3.4 `ardaq::detail::RawEventHeader * artdaq::SharedMemoryEventReceiver::ReadHeader (bool & err)`

Get the Event header.

Parameters

<i>err</i>	Flag used to indicate if an error has occurred
------------	--

Returns

Pointer to RawEventHeader from buffer

Definition at line 76 of file SharedMemoryEventReceiver.cc.

6.25.3.5 int artdaq::SharedMemoryEventReceiver::ReadReadyCount() [inline]

Get the count of available buffers, both broadcasts and data.

Returns

The sum of the available data buffer count and the available broadcast buffer count

Definition at line 80 of file SharedMemoryEventReceiver.hh.

6.25.3.6 bool artdaq::SharedMemoryEventReceiver::ReadyForRead(bool broadcast = false, size_t timeout_us = 1000000)

Determine whether an event is available for reading.

Parameters

<i>broadcast</i>	(Default false) Whether to wait for a broadcast buffer only
<i>timeout_us</i>	(Default 1000000) Time to wait for buffer to become available.

Returns

Whether an event is available for reading

Definition at line 22 of file SharedMemoryEventReceiver.cc.

6.25.3.7 size_t artdaq::SharedMemoryEventReceiver::size() [inline]

Get the size of the data buffer.

Returns

The size of the data buffer

Definition at line 86 of file SharedMemoryEventReceiver.hh.

6.25.3.8 std::string artdaq::SharedMemoryEventReceiver::toString()

Write out information about the Shared Memory to a string.

Returns

String containing information about the current Shared Memory buffers

Definition at line 176 of file SharedMemoryEventReceiver.cc.

The documentation for this class was generated from the following files:

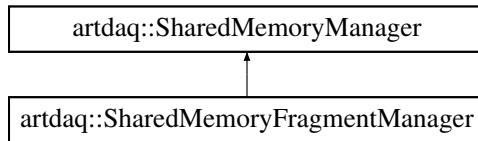

- artdaq-core/artdaq-core/Core/SharedMemoryEventReceiver.hh
- artdaq-core/artdaq-core/Core/SharedMemoryEventReceiver.cc

6.26 artdaq::SharedMemoryFragmentManager Class Reference

The [SharedMemoryFragmentManager](#) is a [SharedMemoryManager](#) that deals with [Fragment](#) transfers using a [SharedMemoryManager](#).

```
#include <artdaq-core/Core/SharedMemoryFragmentManager.hh>
```

Inheritance diagram for artdaq::SharedMemoryFragmentManager:

Public Member Functions

- [SharedMemoryFragmentManager](#) (uint32_t shm_key, size_t buffer_count, size_t max_buffer_size, size_t buffer_timeout_us=100 *1000000)

SharedMemoryFragmentManager Constructor.
- virtual ~[SharedMemoryFragmentManager](#) ()=default

SharedMemoryFragmentManager destructor.
- int [WriteFragment](#) ([Fragment](#) &&fragment, bool overwrite)

Write a Fragment to the Shared Memory.
- int [ReadFragment](#) ([Fragment](#) &fragment)

Read a Fragment from the Shared Memory.
- int [ReadFragmentHeader](#) ([detail::RawFragmentHeader](#) &header)

Read a Fragment Header from the Shared Memory.
- int [ReadFragmentData](#) ([RawDataType](#) *destination, size_t words)

Read Fragment Data from the Shared Memory.

Additional Inherited Members

6.26.1 Detailed Description

The [SharedMemoryFragmentManager](#) is a [SharedMemoryManager](#) that deals with [Fragment](#) transfers using a [SharedMemoryManager](#).

Definition at line 11 of file SharedMemoryFragmentManager.hh.

6.26.2 Constructor & Destructor Documentation

6.26.2.1 artdaq::SharedMemoryFragmentManager::SharedMemoryFragmentManager (`uint32_t shm_key, size_t buffer_count, size_t max_buffer_size, size_t buffer_timeout_us = 100 * 1000000`)

[SharedMemoryFragmentManager](#) Constructor.

Parameters

<code>shm_key</code>	The key to use when attaching/creating the shared memory segment
<code>buffer_count</code>	The number of buffers in the shared memory
<code>max_buffer_size</code>	The size of each buffer
<code>buffer_timeout_us</code>	The maximum amount of time a buffer may be locked before being returned to its previous state. This timer is reset upon any operation by the owning SharedMemoryManager .

Definition at line 5 of file SharedMemoryFragmentManager.cc.

6.26.3 Member Function Documentation

6.26.3.1 int artdaq::SharedMemoryFragmentManager::ReadFragment (`Fragment & fragment`)

Read a [Fragment](#) from the Shared Memory.

Parameters

<code>fragment</code>	Output Fragment object
-----------------------	--

Returns

0 on success

Definition at line 32 of file SharedMemoryFragmentManager.cc.

6.26.3.2 int artdaq::SharedMemoryFragmentManager::ReadFragmentData (`RawDataType * destination, size_t words`)

Read [Fragment](#) Data from the Shared Memory.

Parameters

<code>destination</code>	Destination for data
<code>words</code>	RawDataType Word count to read

Returns

0 on success

Definition at line 61 of file SharedMemoryFragmentManager.cc.

6.26.3.3 int artdaq::SharedMemoryFragmentManager::ReadFragmentHeader (`detail::RawFragmentHeader & header`)

Read a [Fragment](#) Header from the Shared Memory.

Parameters

<i>header</i>	Output Fragment Header
---------------	--

Returns

0 on success

Definition at line 46 of file SharedMemoryFragmentManager.cc.

6.26.3.4 int artdaq::SharedMemoryFragmentManager::WriteFragment (Fragment && fragment, bool overwrite)Write a [Fragment](#) to the Shared Memory.**Parameters**

<i>fragment</i>	Fragment to write
<i>overwrite</i>	Whether to set the overwrite flag

Returns

0 on success

Definition at line 12 of file SharedMemoryFragmentManager.cc.

The documentation for this class was generated from the following files:

- artdaq-core/artdaq-core/Core/SharedMemoryFragmentManager.cc

6.27 artdaq::SharedMemoryManager Class Reference

The [SharedMemoryManager](#) creates a Shared Memory area which is divided into a number of fixed-size buffers. It provides for multiple readers and multiple writers through a dual semaphore system.

```
#include <artdaq-core/Core/SharedMemoryManager.hh>
```

Inheritance diagram for artdaq::SharedMemoryManager:

Public Types

- enum [BufferSemaphoreFlags](#) { [BufferSemaphoreFlags::Empty](#), [BufferSemaphoreFlags::Writing](#), [BufferSemaphoreFlags::Full](#), [BufferSemaphoreFlags::Reading](#) }

The BufferSemaphoreFlags enumeration represents the different possible "states" of a given shared memory buffer.

Public Member Functions

- **SharedMemoryManager** (uint32_t shm_key, size_t buffer_count=0, size_t buffer_size=0, uint64_t buffer_timeout_us=100 *1000000, bool destructive_read_mode=true)

SharedMemoryManager Constructor.
- virtual ~**SharedMemoryManager** () noexcept

SharedMemoryManager Destructor.
- void **Attach** ()

Reconnect to the shared memory segment.
- int **GetBufferForReading** ()

Finds a buffer that is ready to be read, and reserves it for the calling manager.
- int **GetBufferForWriting** (bool overwrite)

Finds a buffer that is ready to be written to, and reserves it for the calling manager.
- bool **ReadyForRead** ()

Whether any buffer is ready for read.
- bool **ReadyForWrite** (bool overwrite)

Whether any buffer is available for write.
- size_t **ReadReadyCount** ()

Count the number of buffers that are ready for reading.
- size_t **WriteReadyCount** (bool overwrite)

Count the number of buffers that are ready for writing.
- std::deque< int > **GetBuffersOwnedByManager** ()

Get the list of all buffers currently owned by this manager instance.
- size_t **BufferDataSize** (int buffer)

Get the current size of the buffer's data.
- void **ResetReadPos** (int buffer)

Set the read position of the given buffer to the beginning of the buffer.
- void **ResetWritePos** (int buffer)

Set the write position of the given buffer to the beginning of the buffer.
- void **IncrementReadPos** (int buffer, size_t read)

Increment the read position for a given buffer.
- void **IncrementWritePos** (int buffer, size_t written)

Increment the write position for a given buffer.
- bool **MoreDataInBuffer** (int buffer)

Determine if more data is available to be read, based on the read position and data size.
- bool **CheckBuffer** (int buffer, **BufferSemaphoreFlags** flags)

Check both semaphore conditions (Mode flag and manager ID) for a given buffer.
- void **MarkBufferFull** (int buffer, int destination=-1)

Release a buffer from a writer, marking it Full and ready for a reader.
- void **MarkBufferEmpty** (int buffer, bool force=false)

Release a buffer from a reader, marking it Empty and ready to accept more data.
- bool **ResetBuffer** (int buffer)

Resets the buffer from Reading to Full. This operation will only have an effect if performed by the owning manager or if the buffer has timed out.
- void **GetNewId** ()

*Assign a new ID to the current **SharedMemoryManager**, if one has not yet been assigned.*
- uint16_t **GetAttachedCount** () const

Get the number of attached SharedMemoryManagers.

- void [ResetAttachedCount \(\) const](#)
Reset the attached manager count to 0.
- int [GetMyId \(\) const](#)
Get the ID number of the current [SharedMemoryManager](#).
- int [GetRank \(\) const](#)
Get the rank of the owner of the Shared Memory (artdaq assigns rank to each artdaq process for data flow)
- void [SetRank \(int rank\)](#)
Set the rank stored in the Shared Memory, if the current instance is the owner of the shared memory.
- bool [IsValid \(\) const](#)
Is the shared memory pointer valid?
- size_t [size \(\) const](#)
Get the number of buffers in the shared memory segment.
- size_t [Write \(int buffer, void *data, size_t size\)](#)
Write size bytes of data from the given pointer to a buffer.
- bool [Read \(int buffer, void *data, size_t size\)](#)
Read size bytes of data from buffer into the given pointer.
- virtual std::string [toString \(\)](#)
Write information about the SharedMemory to a string.
- uint32_t [GetKey \(\) const](#)
Get the key of the shared memory attached to this [SharedMemoryManager](#).
- void * [GetReadPos \(int buffer\)](#)
Get a pointer to the current read position of the buffer.
- void * [GetWritePos \(int buffer\)](#)
Get a pointer to the current write position of the buffer.
- void * [GetBufferStart \(int buffer\)](#)
Get a pointer to the start position of the buffer.
- void [Detach \(bool throwException=false, std::string category="", std::string message ""\)](#)
Detach from the Shared Memory segment, optionally throwing a `cet::exception` with the specified properties.
- uint64_t [GetBufferTimeout \(\) const](#)
Gets the configured timeout for buffers to be declared "stale".
- size_t [GetBufferCount \(\) const](#)
Gets the number of buffers which have been processed through the Shared Memory.
- size_t [GetLastSeenBufferID \(\) const](#)
Gets the highest buffer number either written or read by this [SharedMemoryManager](#).
- size_t [GetLowestSeqIDRead \(\) const](#)
Gets the lowest sequence ID that has been read by any reader, as reported by the readers.
- void [SetMinWriteSize \(size_t size\)](#)
Sets the threshold after which a buffer should be considered "non-empty" (in case of default headers)

Static Public Member Functions

- static std::string [FlagToString \(BufferSemaphoreFlags flag\)](#)
Convert a `BufferSemaphoreFlags` variable to its string representation.

6.27.1 Detailed Description

The [SharedMemoryManager](#) creates a Shared Memory area which is divided into a number of fixed-size buffers. It provides for multiple readers and multiple writers through a dual semaphore system.

Definition at line 18 of file SharedMemoryManager.hh.

6.27.2 Member Enumeration Documentation

6.27.2.1 enum artdaq::SharedMemoryManager::BufferSemaphoreFlags [strong]

The BufferSemaphoreFlags enumeration represents the different possible "states" of a given shared memory buffer.

Enumerator

Empty The buffer is empty, and waiting for a writer.

Writing The buffer is currently being written to.

Full The buffer is full, and waiting for a reader.

Reading The buffer is currently being read from.

Definition at line 25 of file SharedMemoryManager.hh.

6.27.3 Constructor & Destructor Documentation

6.27.3.1 artdaq::SharedMemoryManager::SharedMemoryManager (uint32_t *shm_key*, size_t *buffer_count* = 0, size_t *buffer_size* = 0, uint64_t *buffer_timeout_us* = 100 * 1000000, bool *destructive_read_mode* = true)

[SharedMemoryManager](#) Constructor.

Parameters

<i>shm_key</i>	The key to use when attaching/creating the shared memory segment
<i>buffer_count</i>	The number of buffers in the shared memory
<i>buffer_size</i>	The size of each buffer
<i>buffer_timeout_us</i>	The maximum amount of time a buffer can be left untouched by its owner before being returned to its previous state.
<i>destructive_read_mode</i>	Whether a read operation empties the buffer (default: true, false for broadcast mode)

Definition at line 9 of file SharedMemoryManager.cc.

6.27.4 Member Function Documentation

6.27.4.1 size_t artdaq::SharedMemoryManager::BufferDataSize (int *buffer*)

Get the current size of the buffer's data.

Parameters

<i>buffer</i>	Buffer ID of buffer
---------------	---------------------

Returns

Current size of data in the buffer

Definition at line 335 of file SharedMemoryManager.cc.

6.27.4.2 bool artdaq::SharedMemoryManager::CheckBuffer (int *buffer*, BufferSemaphoreFlags *flags*)

Check both semaphore conditions (Mode flag and manager ID) for a given buffer.

Parameters

<i>buffer</i>	Buffer ID of buffer
<i>flags</i>	Expected Mode flag

Returns

Whether the buffer passed the check

Definition at line 398 of file SharedMemoryManager.cc.

6.27.4.3 void artdaq::SharedMemoryManager::Detach (bool *throwException* = false, std::string *category* = "", std::string *message* = "")

Detach from the Shared Memory segment, optionally throwing a `cet::exception` with the specified properties.

Parameters

<i>throwException</i>	Whether to throw an exception after detaching
<i>category</i>	Category for the <code>cet::exception</code>
<i>message</i>	Message for the <code>cet::exception</code>

Definition at line 616 of file SharedMemoryManager.cc.

6.27.4.4 static std::string artdaq::SharedMemoryManager::FlagToString (BufferSemaphoreFlags *flag*) [inline], [static]

Convert a `BufferSemaphoreFlags` variable to its string representation.

Parameters

<i>flag</i>	BufferSemaphoreFlags variable to convert
-------------	--

Returns

String representation of flag

Definition at line 38 of file SharedMemoryManager.hh.

6.27.4.5 `uint16_t artdaq::SharedMemoryManager::GetAttachedCount() const [inline]`

Get the number of attached SharedMemoryManagers.

Returns

The number of attached SharedMemoryManagers

Definition at line 199 of file SharedMemoryManager.hh.

6.27.4.6 `size_t artdaq::SharedMemoryManager::GetBufferCount() const [inline]`

Gets the number of buffers which have been processed through the Shared Memory.

Returns

The number of buffers processed by the Shared Memory

Definition at line 305 of file SharedMemoryManager.hh.

6.27.4.7 `int artdaq::SharedMemoryManager::GetBufferForReading()`

Finds a buffer that is ready to be read, and reserves it for the calling manager.

Returns

The id number of the buffer. -1 indicates no buffers available for read.

Definition at line 130 of file SharedMemoryManager.cc.

6.27.4.8 `int artdaq::SharedMemoryManager::GetBufferForWriting(bool overwrite)`

Finds a buffer that is ready to be written to, and reserves it for the calling manager.

Parameters

<code>overwrite</code>	Whether to consider buffers that are in the Full and Reading state as ready for write (non-reliable mode)
------------------------	---

Returns

The id number of the buffer. -1 indicates no buffers available for write.

Definition at line 194 of file SharedMemoryManager.cc.

6.27.4.9 `std::deque< int > artdaq::SharedMemoryManager::GetBuffersOwnedByManager()`

Get the list of all buffers currently owned by this manager instance.

Returns

A std::deque<int> of buffer IDs currently owned by this manager instance.

Definition at line 317 of file SharedMemoryManager.cc.

6.27.4.10 void * artdaq::SharedMemoryManager::GetBufferStart (int *buffer*)

Get a pointer to the start position of the buffer.

Parameters

<i>buffer</i>	Buffer ID of buffer
---------------	---------------------

Returns

void* pointer to buffer start position

Definition at line 568 of file SharedMemoryManager.cc.

6.27.4.11 uint64_t artdaq::SharedMemoryManager::GetBufferTimeout() const [inline]

Gets the configured timeout for buffers to be declared "stale".

Returns

The buffer timeout, in microseconds

Definition at line 299 of file SharedMemoryManager.hh.

6.27.4.12 uint32_t artdaq::SharedMemoryManager::GetKey() const [inline]

Get the key of the shared memory attached to this [SharedMemoryManager](#).

Returns

The shared memory key

Definition at line 264 of file SharedMemoryManager.hh.

6.27.4.13 size_t artdaq::SharedMemoryManager::GetLastSeenBufferID() const [inline]

Gets the highest buffer number either written or read by this [SharedMemoryManager](#).

Returns

The highest buffer id written or read by this [SharedMemoryManager](#)

Definition at line 311 of file SharedMemoryManager.hh.

6.27.4.14 int artdaq::SharedMemoryManager::GetMyId() const [inline]

Get the ID number of the current [SharedMemoryManager](#).

Returns

The ID number of the current [SharedMemoryManager](#)

Definition at line 210 of file SharedMemoryManager.hh.

6.27.4.15 int artdaq::SharedMemoryManager::GetRank () const [inline]

Get the rank of the owner of the Shared Memory (artdaq assigns rank to each artdaq process for data flow)

Returns

The rank of the owner of the Shared Memory

Definition at line 216 of file SharedMemoryManager.hh.

6.27.4.16 void * artdaq::SharedMemoryManager::GetReadPos (int *buffer*)

Get a pointer to the current read position of the buffer.

Parameters

<i>buffer</i>	Buffer ID of buffer
---------------	---------------------

Returns

void* pointer to the buffer's current read position

Definition at line 557 of file SharedMemoryManager.cc.

6.27.4.17 void * artdaq::SharedMemoryManager::GetWritePos (int *buffer*)

Get a pointer to the current write position of the buffer.

Parameters

<i>buffer</i>	Buffer ID of buffer
---------------	---------------------

Returns

void* pointer to buffer's current write position

Definition at line 562 of file SharedMemoryManager.cc.

6.27.4.18 void artdaq::SharedMemoryManager::IncrementReadPos (int *buffer*, size_t *read*)

Increment the read position for a given buffer.

Parameters

<i>buffer</i>	Buffer ID of buffer
<i>read</i>	Number of bytes by which to increment read position

Definition at line 364 of file SharedMemoryManager.cc.

6.27.4.19 void artdaq::SharedMemoryManager::IncrementWritePos (int *buffer*, size_t *written*)

Increment the write position for a given buffer.

Parameters

<i>buffer</i>	Buffer ID of buffer
<i>written</i>	Number of bytes by which to increment write position

Definition at line 377 of file SharedMemoryManager.cc.

6.27.4.20 bool artdaq::SharedMemoryManager::IsValid () const [inline]

Is the shared memory pointer valid?

Returns

Whether the shared memory pointer is valid

Definition at line 228 of file SharedMemoryManager.hh.

6.27.4.21 void artdaq::SharedMemoryManager::MarkBufferEmpty (int *buffer*, bool *force* = false)

Release a buffer from a reader, marking it Empty and ready to accept more data.

Parameters

<i>buffer</i>	Buffer ID of buffer
<i>force</i>	Force buffer to empty state (only if manager_id_ == 0)

Definition at line 420 of file SharedMemoryManager.cc.

6.27.4.22 void artdaq::SharedMemoryManager::MarkBufferFull (int *buffer*, int *destination* = -1)

Release a buffer from a writer, marking it Full and ready for a reader.

Parameters

<i>buffer</i>	Buffer ID of buffer
<i>destination</i>	If desired, a destination manager ID may be specified for a buffer

Definition at line 405 of file SharedMemoryManager.cc.

6.27.4.23 bool artdaq::SharedMemoryManager::MoreDataInBuffer (int *buffer*)

Determine if more data is available to be read, based on the read position and data size.

Parameters

<i>buffer</i>	Buffer ID of buffer
---------------	---------------------

Returns

Whether more data is available in the given buffer.

Definition at line 389 of file SharedMemoryManager.cc.

6.27.4.24 bool artdaq::SharedMemoryManager::Read (int *buffer*, void * *data*, size_t *size*)

Read size bytes of data from buffer into the given pointer.

Parameters

<i>buffer</i>	Buffer ID of buffer
<i>data</i>	Destination pointer for read
<i>size</i>	Size of read, in bytes

Returns

Whether the read was successful

Definition at line 514 of file SharedMemoryManager.cc.

6.27.4.25 size_t artdaq::SharedMemoryManager::ReadReadyCount()

Count the number of buffers that are ready for reading.

Returns

The number of buffers ready for reading

Definition at line 274 of file SharedMemoryManager.cc.

6.27.4.26 bool artdaq::SharedMemoryManager::ReadyForRead() [inline]

Whether any buffer is ready for read.

Returns

True if there is a buffer available

Definition at line 93 of file SharedMemoryManager.hh.

6.27.4.27 bool artdaq::SharedMemoryManager::ReadyForWrite(bool *overwrite*) [inline]

Whether any buffer is available for write.

Parameters

<i>overwrite</i>	Whether to allow overwriting full buffers
------------------	---

Returns

True if there is a buffer available

Definition at line 100 of file SharedMemoryManager.hh.

6.27.4.28 bool artdaq::SharedMemoryManager::ResetBuffer(int *buffer*)

Resets the buffer from Reading to Full. This operation will only have an effect if performed by the owning manager or if the buffer has timed out.

Parameters

<i>buffer</i>	Buffer ID of buffer
---------------	---------------------

Returns

Whether the buffer has exceeded the maximum age

Definition at line 450 of file SharedMemoryManager.cc.

6.27.4.29 void artdaq::SharedMemoryManager::ResetReadPos (int *buffer*)

Set the read position of the given buffer to the beginning of the buffer.

Parameters

<i>buffer</i>	Buffer ID of buffer
---------------	---------------------

Definition at line 345 of file SharedMemoryManager.cc.

6.27.4.30 void artdaq::SharedMemoryManager::ResetWritePos (int *buffer*)

Set the write position of the given buffer to the beginning of the buffer.

Parameters

<i>buffer</i>	Buffer ID of buffer
---------------	---------------------

Definition at line 354 of file SharedMemoryManager.cc.

6.27.4.31 void artdaq::SharedMemoryManager::SetMinWriteSize (size_t *size*) [inline]

Sets the threshold after which a buffer should be considered "non-empty" (in case of default headers)

Parameters

<i>size</i>	Size (in bytes) after which a buffer will be considered non-empty
-------------	---

Definition at line 322 of file SharedMemoryManager.hh.

6.27.4.32 void artdaq::SharedMemoryManager::SetRank (int *rank*) [inline]

Set the rank stored in the Shared Memory, if the current instance is the owner of the shared memory.

Parameters

<i>rank</i>	Rank to set
-------------	-------------

Definition at line 222 of file SharedMemoryManager.hh.

6.27.4.33 size_t artdaq::SharedMemoryManager::size () const [inline]

Get the number of buffers in the shared memory segment.

Returns

The number of buffers in the shared memory segment

Definition at line 234 of file SharedMemoryManager.hh.

6.27.4.34 std::string artdaq::SharedMemoryManager::toString() [virtual]

Write information about the SharedMemory to a string.

Returns

String describing current state of SharedMemory and buffers

Definition at line 529 of file SharedMemoryManager.cc.

6.27.4.35 size_t artdaq::SharedMemoryManager::Write(int buffer, void * data, size_t size)

Write size bytes of data from the given pointer to a buffer.

Parameters

<i>buffer</i>	Buffer ID of buffer
<i>data</i>	Source pointer for write
<i>size</i>	Size of write, in bytes

Returns

Amount of data written, in bytes

Definition at line 492 of file SharedMemoryManager.cc.

6.27.4.36 size_t artdaq::SharedMemoryManager::WriteReadyCount(bool overwrite)

Count the number of buffers that are ready for writing.

Parameters

<i>overwrite</i>	Whether to consider buffers that are in the Full and Reading state as ready for write (non-reliable mode)
------------------	---

Returns

The number of buffers ready for writing

Definition at line 298 of file SharedMemoryManager.cc.

The documentation for this class was generated from the following files:

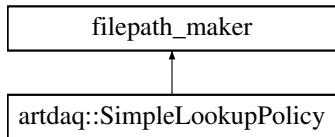

- artdaq-core/artdaq-core/Core/SharedMemoryManager.hh
- artdaq-core/artdaq-core/Core/SharedMemoryManager.cc

6.28 artdaq::SimpleLookupPolicy Class Reference

This class is intended to find files using a set lookup order.

```
#include <artdaq-core/Utilities/SimpleLookupPolicy.hh>
```

Inheritance diagram for artdaq::SimpleLookupPolicy:

Public Types

- enum [ArgType](#) : int { [ArgType::ENV_VAR](#) = 0, [ArgType::PATH_STRING](#) = 1 }
- Flag if the constructor argument is a list of paths or the name of an environment variable.*

Public Member Functions

- [SimpleLookupPolicy](#) (std::string const &paths, [ArgType](#) argType=[ArgType::ENV_VAR](#))
Constructor.
- std::string [operator\(\)](#) (std::string const &filename) override
Perform the file lookup.
- virtual [~SimpleLookupPolicy](#) () noexcept
Default destructor.

6.28.1 Detailed Description

This class is intended to find files using a set lookup order.

This class is intended to find files using the following lookup order:

- the absolute path, if provided
- the current directory
- the specified list of paths

Definition at line 21 of file SimpleLookupPolicy.hh.

6.28.2 Member Enumeration Documentation

6.28.2.1 enum artdaq::SimpleLookupPolicy::ArgType : int [strong]

Flag if the constructor argument is a list of paths or the name of an environment variable.

Enumerator

ENV_VAR Constructor argument is environment variable name.

PATH_STRING Constructor argument is a list of directories.

Definition at line 28 of file SimpleLookupPolicy.hh.

6.28.3 Constructor & Destructor Documentation

6.28.3.1 `artdaq::SimpleLookupPolicy::SimpleLookupPolicy (std::string const & paths, ArgType argType = ArgType::ENV_VAR)`

Constructor.

Parameters

<code>paths</code>	Either the name of an environment variable or a list of directories to search
<code>argType</code>	Flag to determine if paths argument is an environment variable or a list of directories

The [SimpleLookupPolicy](#) Constructor instantiates the `cet::search_path` objects used for file lookup.

Definition at line 5 of file SimpleLookupPolicy.cc.

6.28.4 Member Function Documentation

6.28.4.1 `std::string artdaq::SimpleLookupPolicy::operator() (std::string const & filename) [override]`

Perform the file lookup.

Parameters

<code>filename</code>	The name of the file to find
-----------------------	------------------------------

Returns

The location that the file was found in.

The lookup proceeds in the following order:

- the absolute path, if provided
- the current directory
- the specified list of paths

Definition at line 41 of file SimpleLookupPolicy.cc.

The documentation for this class was generated from the following files:

- artdaq-core/artdaq-core/Utilities/SimpleLookupPolicy.hh
- artdaq-core/artdaq-core/Utilities/SimpleLookupPolicy.cc

6.29 artdaq::SimpleMemoryReader Class Reference

[SimpleMemoryReader](#) will continue to read [RawEvent](#) objects off the queue until it encounters a null pointer, at which point it stops.

```
#include <artdaq-core/Core/SimpleMemoryReader.hh>
```

Public Member Functions

- [SimpleMemoryReader](#) (uint32_t *shm_key*, uint32_t *broadcast_key*, std::size_t *expectedEventCount*=0)
Constructs a SimpleMemoryReader.
- void [run \(\)](#)
Run until a null pointer is popped off of the RawEventQueue. Throws an exception if expectedEventCount is set and a different number of events come off the queue.
Exceptions

std::string	When the expectedEventCount is set and a different number of events come off the queue.
-------------	---

6.29.1 Detailed Description

[SimpleMemoryReader](#) will continue to read [RawEvent](#) objects off the queue until it encounters a null pointer, at which point it stops.

Definition at line 26 of file SimpleMemoryReader.hh.

6.29.2 Constructor & Destructor Documentation

6.29.2.1 artdaq::SimpleMemoryReader::SimpleMemoryReader (uint32_t *shm_key*, uint32_t *broadcast_key*, std::size_t *expectedEventCount* = 0) [explicit]

Constructs a [SimpleMemoryReader](#).

Parameters

<i>shm_key</i>	Key of the shared memory segment
<i>broadcast_key</i>	Key of the broadcast shared memory segment
<i>expectedEventCount</i>	The number of events the SimpleMemoryReader should expect

Definition at line 39 of file SimpleMemoryReader.cc.

The documentation for this class was generated from the following files:

- artdaq-core/artdaq-core/Core/SimpleMemoryReader.hh
- artdaq-core/artdaq-core/Core/SimpleMemoryReader.cc

6.30 artdaq::SimpleQueueReader Class Reference

[SimpleQueueReader](#) will continue to read [RawEvent](#) objects off the queue until it encounters a null pointer, at which point it stops.

```
#include <artdaq-core/Core/SimpleQueueReader.hh>
```

Public Member Functions

- [SimpleQueueReader](#) (std::size_t *expectedEventCount*=0)
Constructs a SimpleQueueReader.
- void [run \(\)](#)
Run until a null pointer is popped off of the RawEventQueue. Throws an exception if expectedEventCount is set and a different number of events come off the queue.

Exceptions

std::string	<i>When the expectedEventCount is set and a different number of events come off the queue.</i>
-------------	--

6.30.1 Detailed Description

`SimpleQueueReader` will continue to read `RawEvent` objects off the queue until it encounters a null pointer, at which point it stops.

Definition at line 26 of file `SimpleQueueReader.hh`.

6.30.2 Constructor & Destructor Documentation**6.30.2.1 artdaq::SimpleQueueReader::SimpleQueueReader(std::size_t expectedEventCount = 0) [explicit]**

Constructs a `SimpleQueueReader`.

Parameters

expectedEvent- Count	The number of events the <code>SimpleQueueReader</code> should expect
-------------------------	---

Definition at line 39 of file `SimpleQueueReader.cc`.

The documentation for this class was generated from the following files:

- artdaq-core/artdaq-core/Core/SimpleQueueReader.hh
- artdaq-core/artdaq-core/Core/SimpleQueueReader.cc

6.31 artdaq::StatisticsCollection Class Reference

A collection of `MonitoredQuantity` instances describing low-level statistics of the `artdaq` system.

```
#include <artdaq-core/Core/StatisticsCollection.hh>
```

Public Member Functions

- virtual `~StatisticsCollection()` noexcept
StatisticsCollection Destructor.
- void `addMonitoredQuantity` (const std::string &name, `MonitoredQuantityPtr` mqPtr)
Registers a new MonitoredQuantity to be tracked by the StatisticsCollection.
- `MonitoredQuantityPtr getMonitoredQuantity` (const std::string &name) const
Lookup and return a MonitoredQuantity from the StatisticsCollection.
- void `reset()`
Reset all MonitoredQuantity object in this StatisticsCollection.
- void `requestStop()`
Stops the statistics calculation thread.
- void `run()`
Start the background thread that performs MonitoredQuantity statistics calculation.

Static Public Member Functions

- static [StatisticsCollection & getInstance \(\)](#)
Returns the singleton instance of the StatisticsCollection.

6.31.1 Detailed Description

A collection of [MonitoredQuantity](#) instances describing low-level statistics of the *artdaq* system.

A collection of [MonitoredQuantity](#) instances describing low-level statistics of the *artdaq* system. Periodically (default 1s) calculates statistics for each [MonitoredQuantity](#) instance.

Definition at line 23 of file StatisticsCollection.hh.

6.31.2 Member Function Documentation

6.31.2.1 void artdaq::StatisticsCollection::addMonitoredQuantity (const std::string & name, MonitoredQuantityPtr mqPtr)

Registers a new [MonitoredQuantity](#) to be tracked by the [StatisticsCollection](#).

Parameters

<i>name</i>	Name of the MonitoredQuantity (used for lookup)
<i>mqPtr</i>	shared_ptr to MonitoredQuantity

Definition at line 25 of file StatisticsCollection.cc.

6.31.2.2 StatisticsCollection & artdaq::StatisticsCollection::getInstance () [static]

Returns the singleton instance of the [StatisticsCollection](#).

Returns

[StatisticsCollection](#) instance.

Definition at line 5 of file StatisticsCollection.cc.

6.31.2.3 MonitoredQuantityPtr artdaq::StatisticsCollection::getMonitoredQuantity (const std::string & name) const

Lookup and return a [MonitoredQuantity](#) from the [StatisticsCollection](#).

Parameters

<i>name</i>	Name of the MonitoredQuantity
-------------	---

Returns

[MonitoredQuantityPtr](#) (nullptr if not found in [StatisticsCollection](#))

Definition at line 33 of file StatisticsCollection.cc.

The documentation for this class was generated from the following files:

- artdaq-core/artdaq-core/Core/StatisticsCollection.hh
- artdaq-core/artdaq-core/Core/StatisticsCollection.cc

6.32 TraceLock Class Reference

The [TraceLock](#) class allows a user to debug the acquisition and releasing of locks, by wrapping the `unique_lock<std::mutex>` API with TRACE calls.

```
#include <artdaq-core/Utilities/TraceLock.hh>
```

Public Member Functions

- [TraceLock](#) (`std::mutex &mutex, int level, std::string description`)
Construct a [TraceLock](#).
- virtual [~TraceLock](#) ()
Release the [TraceLock](#).

6.32.1 Detailed Description

The [TraceLock](#) class allows a user to debug the acquisition and releasing of locks, by wrapping the `unique_lock<std::mutex>` API with TRACE calls.

Definition at line 10 of file TraceLock.hh.

6.32.2 Constructor & Destructor Documentation

6.32.2.1 [TraceLock::TraceLock \(std::mutex & mutex, int level, std::string description \) \[inline\]](#)

Construct a [TraceLock](#).

Parameters

<i>mutex</i>	Mutex to hold lock on
<i>level</i>	Level to TRACE (in the TraceLock TRACE_NAME)
<i>description</i>	Description of lock (to be printed in TRACE calls)

Definition at line 31 of file TraceLock.hh.

The documentation for this class was generated from the following file:

- artdaq-core/artdaq-core/Utilities/TraceLock.hh
